Carla Englander WSBLE Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

David Ross Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement.

I've been following this progress for a while, and while my recommendations take guidance from others, it's not out of automation that I boost these efforts. (For what it's worth)

• Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

• Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

• Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Jennifer Sleath Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. Celeste Gray Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties. When I talk to people about Link, the first critique they have is the escalators. Please don't become even more notorious by over reliance on underperforming vertical conveyances!

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel. The best transfers take seconds. Everything longer is a compromise than needs excellent justification, exponential with the time cost.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

We are going to built a beautiful, fast, efficient network, if we manage to get this right. Otherwise we'll lose out on future growth possibilities by paying for mistakes we don't have to make.

Mario Coll Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. Jason Arends Draft EIS Comment

Manager DEIS Comments,

I'm keeping what Seattle Subway put in below (as I'm sure they've thought this through more than me), but my own thoughts to emphasize are:

-No more escalators! They are broke all the damn time, and it adds time to a trip to ascend/descend from the bowels of the earth. Either a bunch of very fast elevators or put the station way closer to the surface (I have no idea how feasible this is).

-Build stations where people are/will be. If you're going to ballard, go to the part people want to be in! Don't build any more stations that are just a giant parking lot.

-And please look at accelerating the building schedule, if at all possible.

Thank you!

-Jason Arends

Blair Stewart Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put humans first. The expansion must put pedestrians first. The extension must put accessibility first. The extension must provide a 21st century, century long service to our community. Because of its importance, I am writing to submit my comments to Sound Transit's Draft Environmental Statement

I write to SUPPORT:
-Shallow stations to promote shorter travel times, accessibility, and reliability. Deep stations are setting Sound Transit up for future liability! Deep stations require much greater maintenance costs to ensure reliable, ADA compliant access. Shallow stations are setting Sound Transit up for success! Shallow stations better service short trips, and will attract a greater variety and number of riders.

-For stations which must be below ground level: ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

-Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

I write to SUPPORT:
In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: Open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub. CID-1a is the better of the current alternatives.
In Sodo: The Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

I write to SUPPORT future proofing the ST3 expansion by incorporating the following considerations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

I write to OPPOSE:
-Any elimination of stations from what voters approved with ST3 in 2016. Eliminating planned stations is in direct opposition to what the region's voters want and need.

I write to OPPOSE:
In Ballard: All proposed 14th and 15th Ave station configurations. Neither 14th nor 15th ave serve the high density neighborhood that will provide a large portion of riders for this expansion. Neither 14th nor 15th proposed locations put riders first.
In SLU: Both proposed station option locations. Neither proposed options serves the SLU neighborhood ridership now, and will not serve the neighborhood for the rest of the 21st century.

In Chinatown/International District: All deep station alternatives (1b, 2a, and 2b)
In Sodo: The preferred alternative with the staggered station. This alternative doesn't support pedestrians and riders.

Thank you for your review of these comments.

Sincerely,
Blair Stewart

Tyler Doyle Draft EIS Comment

Manager DEIS Comments,

I live in Ballard and have for about 10 years. I love it here, as I get to live in a dense urban neighborhood, with decent transit and a wonderful walkable life for me, my wife, and my dog. However, I would also love GREAT transit to downtown (where I now work) and to get around and explore my city. My comments largely agree with advocacy groups like Seattle Subway and The Urbanist, though I have edited them where I disagree or have more specific requests, so please review this and don't treat it as a simple copy/paste.

My comments start with Ballard: A 14th station, especially with the latest cost refinement idea being to delete the west-side entrance, requires me crossing 24th (where I live, West side), 15th, 14th, and Market in order to reach the train. This is objectively absurd. While there is some medium-density going up in West Woodland/Brewery District it is nothing compared to the historical and continuing density in the Ballard Core.... ESPECIALLY along 24th. I would like a one seat ride to downtown and the airport and I could probably get ride of one of our cars as a family! That's the kind of thing we need to be incentivizing. 14th just doesn't cut it.

I agree with the sentiments from Seattle Subway below:
Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: Open additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: Support Thorndyke Retained Cut [IBB-2a/IBB-2b].
In Smith Cove: Preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.

(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

David Jaoui Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. Evin Fairchild Draft EIS Comment

Manager DEIS Comments,

I believe that the Ballard-West Seattle Link Extension is very important to the city of Seattle and the surrounding region. However, it's design must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement as I have significant concerns about the design of various aspects of this project.

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

It is extremely important to make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: Putting the station on 14th or 15th Ave NW is a horrible choice and a complete waste of money. Not only is it too far from the core of Ballard but it requires crossing a busy, dangerous street in order to actually get there. I strongly urge Sound Transit to reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options as they aren't located in the heart of SLU. Study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and find ways to speed up transfers and surface access. Sound Transit needs to make every effort possible to reduce the depth of this station.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out the ridiculously deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a but closer to the surface, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Isaiah Snell-Feikema Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Isaac Banner Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. Patrick McCarthy Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

Logan Bowers Draft EIS Comment

Manager DEIS Comments,

Hello! I left the generated statement from Seattle Subway because I think on the substance it nails the points I care about. I will say that as a layperson, I see Sound Transit making poor long-term choices with buried stations and/or stations located far from population centers and near freeways. Don't let short-termism degrade what will be a 200 year investment in the city's transportation infrastructure!

Thank you for all your hard work, I know it's not easy.

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Melissa Simpson Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.

In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

John Scott WSBLE Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Manager DEIS Comments,

I've been following along for a while and am firmly behind Seattle Subway's thoughts and suggestions on this.

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

Jillian Cromar WSBLE Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

The proposed location for the SLU stop is not actually located within South Lake Union, and therefore is not useful. There are many many residents of SLU, formerly myself included, and most live along Dexter and Fairview. Placing the stop near 99 will make it near useless - if you can walk to 99 from what is actually residential SLU, you can walk almost as easily to Westlake. Many people commuting into SLU are also commuting to Dexter, Boren, and Mercer, which are not exactly nearby the current proposed location for the SLU stop. This station must be moved to be (1) less deep to facilitate transfers, and (2) placed somewhere actually useful.

If you want to increase ridership on public transit, it must be both accessible and reasonably placed. A station accessed by elevator only is not accessible unless the capacity of the elevators meets or exceeds the capacity of escalators. People WILL NOT use the stop if they have to wait for an elevator. Can you say missed transfers?

I also support all commentary below from Seattle Subway:

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-

99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Dana Hoffman WSBLE Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.

William Cromar WSBLE Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

I am a current Kirkland resident who used to live in SLU. I want to emphasize that the current plan for SLU station is woefully inadequate to serve the people who live and work there. The densest residential part of SLU is between Westlake and I5, and most of the big offices are within a few blocks of Westlake. The proposed SLU station placements are not easily walkable to either area. In order to keep the heart of the neighborhood within the walkshed of the station, the Link should tunnel from the proposed Denny station up to Republican street. Although that puts a new station close to Denny station, that is fully appropriate for a dense downtown area. Our closest peer is probably the BART which gets incredible ridership between relatively close downtown stations. The impacts to the Seattle streetcar during construction are acceptable since 1) this would be a vast, long term investment in SLU's transit access and 2) the streetcar has low ridership that can be substituted by existing buses. I urge you to reconsider the proposed options for SLU and draw up a new plan that best serves the residents and workers of SLU.

Further, I fully support Seattle Subway's recommendations below:

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Johanna Wilder WSBLE Draft EIS Comment

Manager DEIS Comments,

Thank you for reading.

I am fully in agreement with the critique by Seattle Transit Rider's Union and am including their statement.

My personal concerns are that because I have a nervous-system condition that gives me vertigo, it is of the utmost importance that you take seriously the station depth and conveyance concerns, especially the escalators. Already those that are installed are prone to breakdowns, but please make them more accessible to people like me with vertigo.

Thank you for your consideration.

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Jon Mathison WSBLE Draft EIS Comment

Manager DEIS Comments,

Thank you for the opportunity to comment on the DEIS for the Sound Transit expansion. I am a super happy rider and can't wait for the additional expansion to Ballard and beyond.

Please do not tunnel! I want to see Ballard when I go to Ballard and tunneling always has runaway costs that will burden not just the Ballard project but many other projects. Trains should be seen, hide the damn cars in a tunnel!

The idea of putting the train up 15th street and clearing the car sewer is the best idea around.

Please ensure all transfers are well thought through and that we do not end up taking many minutes to get to other platforms.

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Hunter Merrill WSBLE Draft EIS Comment

Manager DEIS Comments,

I am writing to submit my comments to Sound Transit's Draft Environmental Statement for the Ballard-West Seattle Link Extension. Stations can't move after being built, it is critical they are placed where they can benefit the most riders.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.

In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.

At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.

In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.

At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.

In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub. This is the key to making the whole system work.

In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Sam Keller Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. Matthew Bailey Draft EIS Comment

Manager DEIS Comments,

Hello,

I am writing to submit my comments to Sound Transit's Draft Environmental Statement. We need to consider ridership in building ST3.

Please do not eliminate to eliminate planned station. This is against transit riders' needs and voters' wishes. Eliminating stations would undermine trust in Sound Transit.

Learn from European cities that efficiently build transit by making stations shallow and accessible. The proposed depths for Midtown, Westlake, Denny, and Seattle Center stations are absurd and would limit their use. Sound Transit had a bad track record for maintaining escalators and elevators. Don't build stations that you can't expect to maintain.

Efficient transfers are a necessary part of any mass transit system. Please reconsider the proposed vertical and horizontal distance between stations.

I also support these proposals from Seattle Subway:
In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface-to-platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thanks for your time!

Best regards,
Matt

Shane Clyburn WSBLE Draft EIS Comment

Manager DEIS Comments,

Hello,

I am including the statement from Seattle Subway below, but wanted to add a few of my own words as well. I fully agree with everything proposed by them, but also recognize that there is no perfect solution to an issue that's decades behind when it should have been built. What must be done now is whatever is possible to ensure maximum usage and convenience for riders. Deep stations, especially the one proposed in CID, seem almost like sabotage to the potential of this system. We need quick access, simple transfers, and ease of use for all involved. The system needs to be just as useful for folks moving around downtown exploring the city as it is for those commuting to work. It must connect all major neighborhoods, and be designed with future expansion in mind. This is an investment in the long term vitality of this city and will likely set the stage for how Seattle grows for the next century. It must be done right now, and it must be future proof to ensure the entire region benefits and is able to expand with rising demand for generations to come. Let's get it right.

Thank you.

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].

In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

Zackery Thill WSBLE Draft EIS Comment

Manager DEIS Comments,

I am writing to submit my comments to Sound Transit's Draft Environmental Statement. We need to consider ridership in building ST3.

Please do not eliminate to eliminate planned station. This is against transit riders' needs and voters' wishes. Eliminating stations would undermine trust in Sound Transit.

Learn from European cities that efficiently build transit by making stations shallow and accessible. The proposed depths for Midtown, Westlake, Denny, and Seattle Center stations are absurd and would limit their use. Sound Transit had a bad track record for maintaining escalators and elevators. Don't build stations that you can't expect to maintain.

Efficient transfers are a necessary part of any mass transit system. Please reconsider the proposed vertical and horizontal distance between stations

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:

Brandon Berg WSBLE Draft EIS Comment

Manager DEIS Comments,

I am writing to submit my comments and thoughts to Sound Transit's Draft Environmental Statement and strongly believe the Ballard-West Seattle Link Extension must put riders and increased ridership first.

Do not eliminate any stations from what voters approved with ST3 in 2016. Sound Transit should view this as the mandate and failure to deliver on this puts further expansion at risk.

There are a number of specifics that I want to be sure get highlighted:

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expansion and future-proof our investments in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Erin Watkins WSBLE Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement.

Do not eliminate any stations from what voters approved with ST3 in 2016. This region is still growing, Ballard especially. More townhomes and density means we need all our stations, and we needed them 20 years ago.

Other suggestions:

1. Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. Some of the proposed station depths and access plans will increase travel times too much to be useful for short trips, which are essential to appeal to the broadest number of commuters. If you do deep stations, you MUST ensure escalators and elevators are fast, have enough capacity and redundancy to handle rushes, and above all be reliably maintained to minimize failures. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

2. Smooth transfers between the system's growing lines. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

3. Station suggestions:
   In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
   In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
   In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
   At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
   In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible. At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
   At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
   In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
   In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
   In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
   In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

4. The DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is much needed, but cannot be the end of rail expansion in Seattle. The state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility. It benefits transit riders and those who are dependent on cars. More people on transit is less traffic on the aging road infrastructure. Focus on transit first.

5. Here are a few suggestions for expandability:
   a) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
   b) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
   c) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
   d) Midtown must be designed to accommodate future expansion to the east along Madison St.
   e) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your time and consideration.

Sincerely,
Erin Watkins

At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Molly Amber WSBLE Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. Chloe Colella WSBLE Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

James Ferguson WSBLE Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. Below are my comments to Sound Transit's Draft Environmental Statement

Please do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean that we must build the most comprehensive rail network that we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Do make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Please ensure that escalators and elevators are:

(1) fast, as well as
(2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure.

Such elevators should go from street level straight to the platform level - without any mezzanines - in order to deliver passengers to trains as quickly as possible, without creating additional time and accessibility penalties.

Having smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.

In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.

In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].

At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.

In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.

At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.

At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy. Additionally, find ways to speed up transfers and surface access.

In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.

In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.

In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.

In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:

(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).

(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).

(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.

(4) Midtown must be designed to accommodate future expansion to the east along Madison St.

(5) West Seattle should be built for future southern expansion to White Center and Burien.

Jessica Blake WSBLE Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement.

It is clear that the last transit expansion, which saw light rail stations in the U District, Roosevelt, and North Gate regions, were poorly planned and have had horrible consequences for short range commuters who live within 1-2 miles of these stations.

As an example of the serious flaws:

Routes have been eliminated that contained critical connections within Seattle. For example: Upper and Lower Wallingford were connected to each other, Greenlake, and Belltown via the 26X, which was eliminated since the end and start stations overlapped with light rail. Yet these shorter range connections, necessary for maintaining access to grocery, pharmacy, medical and veterinary clinics, and similar necessities were not replaced and the Metro response has been "just walk further to another stop", which does not take into account mobility and accessibility needs.

While a boon for long-range commuters for Northgate, Edmonds, etc., the short range commutes to and from UW from neighboring communities have more than tripled. It takes 45-60 minutes to travel less than 2 miles from Lower Wallingford to UW and back due to the route changes. Yet it takes coworkers in Edmonds and Columbia City 20 minutes to cover a 10-12 mile distance. The Metro priorities of "just walk" are ableist and deny access and services to low income multi-family housing in lower Wallingford but maintain direct and short bus connections for wealthier single-family housing areas in upper Wallingford and Ballard.

Despite having planned and constructed these stations for years, the U District "transit hub" around the U District station is woefully inadequate. The hub transfer stops still lack seating, which is an accessibility issue. The roadways and sidewalks cannot handle the significant extra traffic.

In constructing ST3 locations and stops and resulting transit changes, the following MUST be kept in mind:

1.) Redundancies do not always exist because a bus line starts and stops at existing or future light rail stations. Consider the route and locations that fall between start and end points so that neighborhoods are not cut off from transit and important services.

2.) Keep in mind that not everyone's destination requires taking light rail. Many short range 1-3 mile trips will start and end far away from stations and these connections must be preserved, not distorted or lengthened.

3.) When designing stops and revisions, keep in mind the impact that will be had on traffic and build in sufficient space for seating at all bus and light rail transfer points.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east.
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

These expansions must not disrupt bus traffic or cut off neighborhoods.

Thank you for your review of these comments.

In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Christopher Gay Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

Boris Leonov Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

First, stop building train stations with parking lots, and build them with high density, low-income housing. When people have to get into a car to drive to the train station, it's already too late - (1) they're going to drive to their final destination, and (2) they are still contributing to congestion and pollution. I'm going to be starting a family in this decade, and I want my kids to grow up in a walkable city, not a congested polluted mess.

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Chris Thompson Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Alvin Ko Draft EIS Comment

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement.

Systemwide:

(1) Study Milan method cut and cover within the existing street right of way. (https://pedestrianobservations.com/2021/02/25/cut-and-cover-is-underrated/)

(2) Study full automation. The increase in capacity from operating smaller trains at higher frequency automated operations reduces station size needs (greatly reducing costs) while providing better service. Automated operations also save labor costs.

(3) Review global standards for fire/emergency issues. It's ridiculous a station cannot fit within the 80 ft Fauntleroy due to the local fire code. Sound Transit should plan from the basis of accepted global 'best practice' and seek code changes where they diverge. Updating archaic standards to save hundreds of millions is a no-brainer.

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth means we must build the most comprehensive rail network we can to promote transit-oriented development and decrease vehicle use. Eliminating planned stations is in direct opposition to what the region's voters want and need. Maximizing ridership and long-term growth are the goals. Short-term construction impacts can be mitigated and must not prevent the better options from being selected.

Shallower stations reduce cost, and risk of project delay while promoting shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game-day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Ballard: Study pairing a high bridge with an elevated 15th Avenue station and continue to refine all tunnel options to put a station entrance west of 15th Avenue. Reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.

Interbay: Advance and refine Thorndyke Retained Cut [IBB-2a/IBB-2b] and a slimmed-down 15th Avenue Elevated Station [IBB-3]

Smith Cove: Build the preferred Galer Street Station/Central Interbay [SIB-1].

Seattle Center: Build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.

SLU: Reject both presented options, study a Westlake or similarly north-south aligned station within SLU boundaries and as centered on South Lake Union as possible. Harrison Street is preferred as the 'less bad' option currently under consideration.

Denny: Build Westlake Ave Station [DT-1] to line up with an SLU station on Westlake further north, but update vertical conveyances and aim shallower.

Westlake: Build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.

Midtown: Build the station as shallow as possible, design the station for the surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.

Chinatown/International District: Build the 4th Avenue Shallow Alternative (CID-1a) alignment but please make it shallower. Study making it as shallow as the existing CID station by using a shallow tunnel over the existing Downtown Seattle Transit Tunnel to reach Midtown. The transfers must be quicker than four and a half minutes. Throw out deep tunnel options.

Sodo: Choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.

Delridge: Request a study of improved DEL-6 options that are compatible with the Medium 41st Avenue Tunnel [WSJ-5].

Avalon: Build WSJ-5 with a request to study a refined DEL-6 pairing.

Junction: Build Medium Tunnel 41st Avenue Station [WSJ-5], but study a refined Elevated Fauntleroy Station that would reduce residential displacement and costly property takings.

In order to future proof our growing system, we must design for expandability in five locations:

(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

The Ballard-West Seattle Link Extension must put riders and increased ridership first.

Most important, in Chinatown/International District: Go forth on fourth, and avoid the historic 5th Avenue and displacing businesses ! The Asian American community has recently suffered impacts from COVID, anti-Asian hate, and rampant crime. Don't build in a historic area. Also, throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub. I live in Capitol Hill and one of the elevators (Denny/Nagle place) has been out all week and I've witnessed the problems this causes for people with disabilities, wheel-chair user, bicyclists, etc. The deeper the station, the more potential failure points and more challenges. Keep in mind the percentage of elders in the Asian population.

In particular, the city owes it to the the community to not repeat the same transgressions of the past, such as I-5 construction which cut right through the neighborhood, destroying many Chinese and Japanese owned businesses and homes. Or the Kingdome, which also negatively impacted the character of the area and created many stresses. Don't do it again. Listen to the people!

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:

Jennifer Simpson Draft EIS Comment

Manager DEIS Comments,

I love mass transit, I love trains. I lived in Tokyo for three years. But that means I have rather high standards, which I know we can meet: the Ballard-West Seattle Link Extension must put riders and increased ridership first.

Most important, in Chinatown/International District: Go forth on fourth, and avoid the historic 5th Avenue and displacing businesses ! The Asian American community has recently suffered impacts from COVID, anti-Asian hate, and rampant crime. Don't build in a historic area. Also, throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub. I live in Capitol Hill and one of the elevators (Denny/Nagle place) has been out all week and I've witnessed the problems this causes for people with disabilities, wheel-chair user, bicyclists, etc. The deeper the station, the more potential failure points and more challenges. Keep in mind the percentage of elders in the Asian population.

In particular, the city owes it to the the community to not repeat the same transgressions of the past, such as I-5 construction which cut right through the neighborhood, destroying many Chinese and Japanese owned businesses and homes. Or the Kingdome, which also negatively impacted the character of the area and created many stresses. Don't do it again. Listen to the people!

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.

In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).

(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Oleg Pakhnyuk Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

Theodore Wiederhold Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Communication (4/26/2022)

I am a West Seattle / N. Delridge resident, and have several concerns about SoundTransit's proposed options for light rail extension. I and several members in my N. Delridge neighborhood strongly favor the SkyLink option vs. train, and ask that Sound Transit consider this efficient, cost effective, lower environmental impact alternative.

I have personally ridden and seen gondola technology in urban markets work extremely well. They are highly efficient, attractive modes of transport in both Bogota and Medellin, Colombia; Hong Kong; and Singapore. They are especially effective in mixed terrain and hills, as is the case between West Seattle and SODO.

While there are numerous advantages to gondola technology's solution for West Seattle, 3 principal reasons stand out for electing this option:
1- significant taxpayer cost savings
2- speed of development with FAR LESS environmental impact
3- less community disruption

1: Project funding/cost
Chapter 2.8.2.1.1 lists the many alternatives contemplated in the DEIS and the associated total costs between $3 billion and $4.7 billion which is about double or triple the amount approved by voters in ST3 ($1.7 billion). Before the pandemic, three West Seattle buses (RapidRide-C, #121, #21) already provided 25,500 trips daily. The DEIS projects 27,000 trips on light rail by 2042, only 1500 more than buses were providing in early 2020. There will be little improvement in travel time for many riders, given the likely need to take a bus to a West Seattle light rail station and then disembark at SODO and wait for another light rail train to go anywhere else for at least the next 15 years. See Transit Time category that follows.

Table 2-9 of App. N indicates Sound Transit estimates light rail to reduce 400 vehicle trips on the West Seattle Bridge by 2042. At a light rail cost of almost $10 million per additional daily trip (plus the building of additional OMF capacity and train acquisition) and an annual operating cost of $35 to $40
million this investment does not seem worthwhile – and that's without considering the cost to the environment of greenhouse gases emitted during construction.

Gondola technology has been proposed by citizens since 2015 but always ignored or dismissed as incapable of serving regional transit needs despite the fact that it is being suggested, not as a regional mode, but as a high-capacity feeder for a densely developed terrain with hills and water obstacles where light rail is difficult, expensive, and damaging to build. Other light rail corridors such as from SODO to Georgetown/South Park could provide a more economical way (both in construction and annual
operation) to provide light rail to the Duwamish peninsula.

2-3: Acquisitions, Displacements, and Relocations
Chapter 4.2.1 relates to the devastating impact of various light rail alignments on residences, businesses, parks, and wildlife. Sound Transit is obligated to minimize such (mandated by DOT section 4(f) for example, see chapter 4.2.18). SkyLink would avoid most of the impact listed in this chapter and therefore the current DEIS fails the "Least Harm Analysis" test in 4.2.18.5.
A 2014 Sound Transit paper on mode choices for the regional transit network stated: "Several of the technologies that have moderate to high HCT capabilities, but are generally less suitable for Sound Transit, could be considered for some service if that service would operate on principally exclusive rights of-way and is not intended to interline (i.e., share the same tracks) with the light rail 'spine,' which extends from Everett to Tacoma, and from Seattle to Redmond." When Sound Transit issued the April 7, 2022 Gondola Feasibility Report, it reiterated this statement in dismissing "SkyLink's" proposal from consideration. SkyLink is proposing a gondola to serve not as the primary mode of the regional network but as a feeder from the ST3 designated station locations to the main spine of the light
rail system. An urban gondola could provide the capacity needed, could be constructed with minimal disruption, displacement, and damage to the environment and established community. Specifically, it would avoid the following problems caused by proposed light rail alternatives:

- Chapter 4.2.1.3: More than a thousand people may have to find new homes, just as many employees will have to find a new place of employment, many current stores and services may not be available in West Seattle anymore.
- Chapter 4.2.1.7/8 misrepresents the housing situation in West Seattle. While Redfin practically shows NO available home inventory in West Seattle, the DEIS just says: "research indicates that there are adequate opportunities for most residents and businesses to successfully relocate within the project vicinity." It promises relocation assistance but fails to mention that no assistance can help if the renter or homeowner cannot qualify for a new home based on current social status / credit rating. Commercial real-estate is very limited in West Seattle which mean displaced businesses may have to relocate causing them to lose their customer base and West Seattle residents may have to travel longer distances to get services.

- Chapter 4.2.3.3 includes several pages of huge impacts. It talks about the fact that light rail will destroy businesses, reduce the city's tax base and may affect tribal fishing rights. It fails to address the social impact for the employees and owners affected by this destruction, many of them small businesses whose livelihood is affected. It does not address the strain on the social services. Even more importantly it does not address the impact to the community which has grown around these services and the businesses and families which will be impacted indirectly. Alki Beach Academy for example provides daycare services to 300 children; affected parents may need to quit their jobs or move elsewhere if they lose affordable daycare.
- Chapter 4.2.4.3 and 4.2.5 fail to address the visual impact of the light rail bridge. No accompanying special renderings other than architectural drawings are provided. Instead, it claims it is "consistent with existing views." While the existing West Seattle freeway is already an eyesore, it only rises briefly above the West Duwamish waterway whereas the southern light rail bridge alignments will rise up high from the SODO station to cross the freeway and stay high until they meet the top of Pigeon Point. The northern bridge alignment will be only slightly lower. This huge structure will be visible not only from Pigeon Point but all along the Duwamish, Beacon Hill, Georgetown, SODO and even T-Mobile Park. No renderings of this have been provided. The impact to the Youngstown neighborhood may be even greater. At one point, the elevated guideway will be as high as 150 ft, about twice as high as any existing building in the neighborhood. Due to the height of the structure, rail noise will travel even farther.
- Chapter 4.2.4.4 does not address the fact that West Seattle has already suffered the last two years from the closure of the West Seattle bridge and the construction required for RapidRide-H. Now all major arterials and transit ways to enter the center of West Seattle (see App. N.1-4 Fauntleroy Way partial closure by up to 1.5 years, 35th Ave by 3 years, and Delridge Way by 3 years) will be impacted by multi-year construction and related detours. While tunneling may help reduce the destruction of some homes and businesses, the excavation required for station construction will require very large construction sites with applicable detours.
- Figure 4.2.5-4 does not show any coverings over the station therefore making it appear lower than it is. It only shows the destruction of homes directly adjacent to the station, but not along the guideway which again provides a distorted impression of what will happen.
- Chapter 4.2.5.3.3 fails to mention that Olmsted already suggested to preserve the view from Pigeon Point which any of the southern alignments would destroy, for details: Pigeon Point - West Duwamish Greenbelt – Friends of Seattle's Olmsted Parks (seattleolmsted.org).

Please consider what is a smarter, safer, faster and far more economical option than light rail -- SkyLink is the right choice for this area.

Thank you.

Communication (4/27/2022)

I am a West Seattle / N. Delridge resident and have several concerns about SoundTransit's proposed options for light rail extension. I and several members in my N. Delridge neighborhood strongly favor the SkyLink option vs. train, and ask that Sound Transit consider this efficient, cost effective, lower environmental impact alternative.

While there are numerous advantages to gondola technology's solution for West Seattle, 3 principal reasons stand out for electing this option:
1- significant taxpayer cost savings
2- speed of development with FAR LESS environmental impact
3- less community disruption

1: Project funding/cost
Chapter 2.8.2.1.1 lists the many alternatives contemplated in the DEIS and the associated total costs between $3 billion and $4.7 billion which is about double or triple the amount approved by voters in ST3 ($1.7 billion). Before the pandemic, three West Seattle buses (RapidRide-C, #121, #21) already provided 25,500 trips daily. The DEIS projects 27,000 trips on light rail by 2042, only 1500 more than buses were providing in early 2020. There will be little improvement in travel time for many riders, given the likely need to take a bus to a West Seattle light rail station and then disembark at SODO and wait for another light rail train to go anywhere else for at least the next 15 years. See Transit Time category that follows.

Table 2-9 of App. N indicates Sound Transit estimates light rail to reduce 400 vehicle trips on the West Seattle Bridge by 2042. At a light rail cost of almost $10 million per additional daily trip (plus the building of additional OMF capacity and train acquisition) and an annual operating cost of $35 to $40 million this investment does not seem worthwhile – and that's without considering the cost to the environment of greenhouse gases emitted during construction.

Gondola technology has been proposed by citizens since 2015 but always ignored or dismissed as incapable of serving regional transit needs despite the fact that it is being suggested, not as a regional mode, but as a high-capacity feeder for a densely developed terrain with hills and water obstacles where light rail is difficult, expensive, and damaging to build. Other light rail corridors such as from SODO to Georgetown/South Park could provide a more economical way (both in construction and annual operation) to provide light rail to the Duwamish peninsula.

2-3: Acquisitions, Displacements, and Relocations
Chapter 4.2.1 relates to the devastating impact of various light rail alignments on residences, businesses, parks, and wildlife. Sound Transit is obligated to minimize such (mandated by DOT section 4(f) for example, see chapter 4.2.18). SkyLink would avoid most of the impact listed in this chapter and therefore the current DEIS fails the "Least Harm Analysis" test in 4.2.18.5.

A 2014 Sound Transit paper on mode choices for the regional transit network stated: "Several of the technologies that have moderate to high HCT capabilities, but are generally less suitable for Sound Transit, could be considered for some service if that service would operate on principally exclusive rights of-way and is not intended to interline (i.e., share the same tracks) with the light rail 'spine,' which extends from Everett to Tacoma, and from Seattle to Redmond." When Sound Transit issued the April 7, 2022 Gondola Feasibility Report, it reiterated this statement in dismissing "SkyLink's" proposal from consideration. SkyLink is proposing a gondola to serve not as the primary mode of the regional network but as a feeder from the ST3 designated station locations to the main spine of the light rail system. An urban gondola could provide the capacity needed, could be constructed with minimal disruption, displacement, and damage to the environment and established community. Specifically, it would avoid the following problems caused by proposed light rail alternatives:

- Chapter 4.2.1.3: More than a thousand people may have to find new homes, just as many employees will have to find a new place of employment, many current stores and services may not be available in West Seattle anymore.
- Chapter 4.2.1.7/8 misrepresents the housing situation in West Seattle. While Redfin practically shows NO available home inventory in West Seattle, the DEIS just says: "research indicates that there are adequate opportunities for most residents and businesses to successfully relocate within the project vicinity." It promises relocation assistance but fails to mention that no assistance can help if the renter or homeowner cannot qualify for a new home based on current social status / credit rating. Commercial real-estate is very limited in West Seattle which mean displaced businesses may have to relocate causing them to lose their customer base and West Seattle residents may have to travel longer distances to get services.
- Chapter 4.2.3.3 includes several pages of huge impacts. It talks about the fact that light rail will destroy businesses, reduce the city's tax base and may affect tribal fishing rights. It fails to address the social impact for the employees and owners affected by this destruction, many of them small businesses whose livelihood is affected. It does not address the strain on the social services. Even more importantly it does not address the impact to the community which has grown around these services and the businesses and families which will be impacted indirectly. Alki Beach Academy for example provides daycare services to 300 children;

affected parents may need to quit their jobs or move elsewhere if they lose affordable daycare.

- Chapter 4.2.4.3 and 4.2.5 fail to address the visual impact of the light rail bridge. No accompanying special renderings other than architectural drawings are provided. Instead, it claims it is “consistent with existing views.” While the existing West Seattle freeway is already an eyesore, it only rises briefly above the West Duwamish waterway whereas the southern light rail bridge alignments will rise up high from the SODO station to cross the freeway and stay high until they meet the top of Pigeon Point. The northern bridge alignment will be only slightly lower. This huge structure will be visible not only from Pigeon Point but all along the Duwamish, Beacon Hill, Georgetown, SODO and even T-Mobile Park. No renderings of this have been provided. The impact to the Youngstown neighborhood may be even greater. At one point, the elevated guideway will be as high as 150 ft, about twice as high as any existing building in the neighborhood. Due to the height of the structure, rail noise will travel even farther.
- Chapter 4.2.4.4 does not address the fact that West Seattle has already suffered the last two years from the closure of the West Seattle bridge and the construction required for RapidRide-H. Now all major arterials and transit ways to enter the center of West Seattle (see App. N.1-4 Fauntleroy Way partial closure by up to 1.5 years, 35th Ave by 3 years, and Delridge Way by 3 years) will be impacted by multi-year construction and related detours. While tunneling may help reduce the destruction of some homes and businesses, the excavation required for station construction will require very large construction sites with applicable detours.
- Figure 4.2.5-4 does not show any coverings over the station therefore making it appear lower than it is. It only shows the destruction of homes directly adjacent to the station, but not along the guideway which again provides a distorted impression of what will happen.
- Chapter 4.2.5.3.3 fails to mention that Olmsted already suggested to preserve the view from Pigeon Point which any of the southern alignments would destroy, for details: Pigeon Point - West Duwamish Greenbelt – Friends of Seattle's Olmsted Parks (seattleolmsted.org).

Please consider what is a smarter, safer, faster and far more economical option than light rail -- SkyLink is the right choice for this area.

Thank you.

Communication (4/27/2022)

I implore Sound Transit to put riders and increased ridership first. These must be elevated above any concerns for short term construction impacts, cost, or business interests. I am writing to submit my comments to Sound Transit's Draft Environmental Statement.

Do not eliminate any stations from what voters approved with the ST3 vote back in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines are paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.

At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

To future proof our growing system, we must design for expandability in four key locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

I am commenting on the Chinatown-International District portion of the Ballard link extension. I strongly prefer the 4th Avenue alternatives and prefer the 4th Avenue Shallow Alternative (CID-1a) alignment. Please make it shallower. Study making it as shallow as the existing CID station by using a shallow tunnel over the existing Downtown Seattle Transit Tunnel to reach Midtown. The transfers must be quicker than 4.5 minutes.

Please prioritize reducing displacement of businesses in the CID historic core -- less than 5 -- and provide any displaced businesses with generous relocation assistance. Please prioritize mitigation of construction impacts on residents and neighborhood landmarks. 5th Avenue alternatives have unacceptable impacts on the historic core of the CID and would result in inequitable displacement of a neighborhood and communities that continue to fight for their very survival in our city.

Regarding the rest of Ballard link and West Seattle link, I support the priorities and alternatives preferred by The Urbanist.

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.

At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

Communication (4/28/2022)

Junction: Prefer Medium Tunnel 41st Avenue Station [WSJ-5], but study a refined Elevated Fauntleroy Station that would reduce residential displacement and costly property takings.

Avalon: Prefer WSJ-5 with a request to study a refined DEL-6 pairing.

Delridge: Request a study of improved DEL-6 options that are compatible with the Medium 41st Avenue Tunnel [WSJ-5]

SoDo: Choose Mixed Profile Station [SoDo-2] and study siting further north at the existing SoDo Station location to avoid costly post office taking.

Prefer 4th Avenue Shallow Alternative (CID-1a) alignment but please make it shallower. Study making it as shallow as the existing CID station by using a shallow tunnel over the existing Downtown Seattle Transit Tunnel to reach Midtown. The transfers must be quicker than four and a half minutes.

Midtown: Make the station as shallow as possible, design station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.

Westlake: 5th Avenue Station [DT-1]. Update the elevator and escalator plan to improve ease of use and redundancy and find ways to speed up transfers and surface access.

Denny: Westlake Avenue Station [DT-1]. Update vertical conveyances and aim shallower.

SLU: Prefer Harrison Street as the less bad option included, but study a Westlake Avenue or similar alignment centered in South Lake Union as much as possible.

Uptown: Prefer Republican Street Station and work to mitigate impacts to arts organizations to the extent possible.

Smith Cove: Preferred Galer Street Station [SIB-1].

Interbay: Advance and refine Thorndyke Retained Cut [IBB-2a/IBB-2b] and a slimmed down 15th Avenue Elevated Station [IBB-3].

Ballard: Study pairing a high bridge with an elevated 15th Avenue Station and to continue to refine all tunnel options to put a station entrance west of 15th Avenue. Jettison the moveable bridge. Open additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.

Communication ID: 503257

Communication (4/28/2022)

Overall Feedback:
Do not eliminate any stations.
Work to make stations as shallow as possible.
Improve transfer times wherever possible.

Ensure escalators and elevators are (1) fast and (2) have enough redundancy to handle game day rushes and not fail riders in the event of failure.
Use fast surface-to-platform elevators (no mezzanines) when stations are more than 100 feet deep and align station design so that it's possible.
Plan to build for future expansion in Seattle.

Neighborhood specific feedback:
Ballard: Open additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
Interbay: Support Thorndyke Retained Cut [IBB-2a/IBB-2b].
Smith Cove: Preferred Galer Street Station/Central Interbay [SIB-1].
SLU: Reject both presented options, study a Westlake or similar alignment oriented north/south within SLU boundaries and as centered on South Lake Union as possible.

Denny Station: Westlake Ave Station [DT-1]. Update vertical conveyances and aim shallower.
Westlake: 5th Ave Station [DT-1]. Update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
Midtown: Make the station as shallow as possible, design station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
CID: Prefer 4th Avenue Shallow Alternative (CID-1a) alignment but it needs to be as shallow as existing station, study a shallow cut and cover option over existing Downtown Seattle Transit Tunnel.
Sodo: Choose Mixed Profile Station [SoDo-2] and study construction further North at the existing SoDo Station location.
West Seattle: Choose WSJ-5 with a request to study better DEL-6 that are compatible with WSJ-5.

Communication (4/28/2022)

I'm a West Seattle resident who doesn't have a driver's license (and doesn't plan ever to, for many reasons) so the future of light rail to West Seattle is of vital importance to me. I hope you realize that light rail expansion is a once-in-a-lifetime investment that we cannot afford to get wrong. Every time a segment of light rail has opened it has been revolutionary for the communities involved. It will continue to be so but only if we make smart, future-thinking, climate-forward choices.

Ballard: Open additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
Interbay: Support Thorndyke Retained Cut [IBB-2a/IBB-2b].
Smith Cove: Preferred Galer Street Station/Central Interbay [SIB-1].
Seattle Center: STRONGLY prefer Republican Street Station and work to mitigate impacts to arts organizations as much as possible. Moving the station off campus would be a historic mistake that Seattle will regret for a century.
SLU: Reject both presented options, study a Westlake or similar alignment oriented north/south within SLU boundaries and as centered on South Lake Union as possible.
Denny: Westlake Ave Station [DT-1]. Update vertical conveyances and aim shallower.
Westlake: 5th Ave Station [DT-1]. Update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
Midtown: Make the station as shallow as possible, design station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
CID: Prefer 4th Avenue Shallow Alternative (CID-1a) alignment but it needs to be as shallow as existing station, study a shallow cut and cover option over existing Downtown Seattle Transit Tunnel.
SODO: Choose Mixed Profile Station [SoDo-2] and study construction further North at the existing SoDo Station location.
West Seattle: Choose WSJ-5 with a request to study better DEL-6 that are compatible with WSJ-5.

In general:
Do not eliminate any stations.
Work to make stations as shallow as possible.
Improve transfer times wherever possible. This cannot be stressed enough!!!
Ensure escalators and elevators are (1) fast and (2) have enough redundancy to handle game day rushes and not fail riders in the event of failure.
Use fast surface-to-platform elevators (no mezzanines) when stations are more than 100 feet deep and align station design so that it's possible.
Plan to build for future expansion in Seattle.

Thank you!

Hello, I hope these are concise and to the point but at the end of everything the Ballard-West Seattle Link Extension must put riders and increased ridership first.

Your target should be to build a solution that would help a single parent who speaks English as a second language, has a bad back, and is holding down 2 part-time jobs.

- We must not eliminate ANY stations from what voters approved with ST3 in 2016. If planned stations are removed, that is in direct opposition to what the region's voters want and need.
- All stations should be built as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters.

-Deep and high-capacity stations also call for excellent vertical conveyances, which is proven to have not been a priority in the past. This pattern has to be broken. Elevators and escelators cannot fail riders or trap them from alternatives in the event of mechanical failure.

- Creating large capacity areas other than elevators will allow optimal use of the elevators by less physically able-bodied individuals, allowing them to still use our transit to the fullest extent. Ensure escalators and elevators are both fast while having enough capacity and redundancy to handle traffic like game-day rushes.
- Elevators should go from street level straight to the platform level, without mezzanines to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.
- Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.
- In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment. If we are to anticipate expanding our transit system off of this current expansion, we need a better and more flexible solution.
- In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
- In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
- At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible. The organizations here have had to deal with quite a bit of disruption from the pandemic and Climate Arena's construction, and additional disruption and impacts should be heavily weighed and avoided when possible.
- In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible. This will allow better expansion opportunities and quicker transfers which will increase usage.
- At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower. Having to navigate 3-4 different mezzanines to reach your
- At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
- In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
- In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
  In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

Communication (4/24/2022)

John Birnel Draft EIS Comment

Dear Sound Transit-I love to go to West Seattle to visit friends and for an exercise class, among other reasons. I look forward to a faster and more reliable way to get there via mass transit. At age 75, I would strongly prefer an option that is more quickly achieved. I also figure that a light rail feeder would be too destructive, and ineffective, and would take way too long, causing traffic to be worse rather than better for such a long time. I prefer a serious look at a gondola system. I also question the sincerity of the effort for a quality EIS if the Ballard and W. Seattle feeder lines are considered as one.

Structure of the DEIS Project
Chapter 1.3 addresses West Seattle and Ballard (incl. downtown) as one project. While many chapters are separate for each portion, others are combined. Why are these two separate project treated together when they do not even connect directly and are built on different timelines? A lot of detail has been lost by treating the separate segments as one and this should be rectified for the final EIS.

Environmental Impact
Chapter 1.2.2.6 points out the need to reduce vehicle miles by 30 percent by 2035. However light rail will not connect West Seattle to the SODO light rail station until 2032 and won't be extended farther until at least 2037. That won't provide much incentive for drivers to switch to public transit (as stated in Table 4.2.6). Even after 2037 the expected savings in vehicle miles are minuscule while there will be a huge carbon impact caused by the construction. Light rail's carbon footprint should be considered, and a proper (outside expert) study done to compare gondola and light rail carbon footprints in construction and operation.
Appendix L4.6 references carbon consumption, citing that "general FTA estimates" were applied. However, no federal project has ever been as large as the 2+ mile, 8 to 16-story tall elevated light rail guideway planned for West Seattle. Energy consumption during construction was not even considered. (Chapter 4.2.10 says "The FTA Greenhouse Gas Emissions Estimator was not used.") Therefore, the carbon figures for the elevated alternatives will be much higher than general FTA estimates. A proper impact evaluation for various alignments and possible other modes, such as bus and gondola, would involve using tools such as the Embodied Carbon in Construction Calculator (EC3) (developed by the nonprofit, Building Transparency) and be conducted in close consultation with objective environmental science organizations like the Carbon Leadership Forum (CLF), a nonprofit, industry-academic organization at the University of Washington. Calculations also need to account for any displacement of existing structures which ultimately have to be replaced in some way.
Chapter 4.2.6.3 fails to explain why a reduction of 400 trips on the West Seattle bridge (see Table 2-9 of App. N) would contribute to savings of 117,000 miles per day in the region. Even if calculations were accurate, the construction related carbon as estimated in Appendix L4.6D is between 158,067 and 614,461 tons, and the regional, annual carbon reduction from vehicles (Table 4.2.6-2) 10,941 tons once the light rail connects directly downtown in 2037 as the earliest. Approximately a third of this would be attributable to West Seattle. It may take between 42 to 168 years to offset the West Seattle light rail construction related carbon emissions. The DEIS fails to mention that a gondola could provide reliable, grade separate public transit a decade earlier than light rail while generating substantially fewer greenhouse gases during construction. That would significantly contribute to meeting the goal for 30% reduction by 2035.

Acquisitions, Displacements, and Relocations
Chapter 4.2.1 relates to the devastating impact of various light rail alignments on residences, businesses, parks, and wildlife. Sound Transit is obligated to minimize such (mandated by DOT section 4(f) for example, see chapter 4.2.18). SkyLink would avoid most of the impact listed in this chapter and therefore the current DEIS fails the "Least Harm Analysis" test in 4.2.18.5.
As stated previously, a 2014 Sound Transit paper on mode choices for the regional transit network said: "Several of the technologies that have moderate to high HCT capabilities, but are generally less suitable for Sound Transit, could be considered for some service if that service would operate on principally exclusive rights of-way and is not intended to interline (i.e., share the same tracks) with the light rail 'spine,' which extends from Everett to Tacoma, and from Seattle to Redmond."
When Sound Transit issued the April 7, 2022 Gondola Feasibility Report, it reiterated this statement in dismissing "SkyLink's" proposal from consideration. SkyLink is proposing a gondola to serve not as the primary mode of the regional network but as a feeder from the ST3 designated station locations to the main spine of the light rail system. An urban gondola could provide the capacity needed, could be constructed with minimal disruption, displacement, and damage to the environment and established community. Specifically, it would avoid the following problems caused by proposed light rail alternatives:

- Chapter 4.2.1.3: More than a thousand people may have to find new homes, just as many employees will have to find a new place of employment, many current stores and services may not be available in West Seattle anymore.

- Chapter 4.2.1.7/8 misrepresents the housing situation in West Seattle. While Redfin practically shows NO available home inventory in West Seattle, the DEIS just says: "research indicates that there are adequate opportunities for most residents and businesses to successfully relocate within the project vicinity." It promises relocation assistance but fails to mention that no assistance can help if the renter or homeowner cannot qualify for a new home based on current social status / credit rating. Commercial real-estate is very limited in West Seattle which mean displaced businesses may have to relocate causing them to lose their customer base and West Seattle residents may have to travel longer distances to get services.
- Chapter 4.2.3.3 includes several pages of huge impacts. It talks about the fact that light rail will destroy businesses, reduce the city's tax base and may affect tribal fishing rights. It fails to address the social impact for the employees and owners affected by this destruction, many of them small businesses whose livelihood is affected. It does not address the strain on the social services. Even more importantly it does not address the impact to the community which has grown around these services and the businesses and families which will be impacted indirectly. Alki Beach Academy for example provides daycare services to 300 children; affected parents may need to quit their jobs or move elsewhere if they lose affordable daycare.
- Chapter 4.2.4.3 and 4.2.5 fail to address the visual impact of the light rail bridge. No accompanying special renderings other than architectural drawings are provided. Instead, it claims it is "consistent with existing views." While the existing West Seattle freeway is already an eyesore, it only rises briefly above the West Duwamish waterway whereas the southern light rail bridge alignments will rise up high from the SODO station to cross the freeway and stay high until they meet the top of Pigeon Point. The norther bridge alignment will be only slightly lower. This huge structure will be visible not only from Pigeon Point but all along the Duwamish, Beacon Hill, Georgetown, SODO and even T-Mobile Park. No renderings of this have been provided. The impact to the Youngstown neighborhood may be even greater. At one point, the elevated guideway will be as high as 150 ft, about twice as high as any existing building in the neighborhood. Due to the height of the structure, rail noise will travel even farther.
- Chapter 4.2.4.4 does not address the fact that West Seattle has already suffered the last two years from the closure of the West Seattle bridge and the construction required for RapidRide-H. Now all major arterials and transit ways to enter the center of West Seattle (see App. N.1-4 Fauntleroy Way partial closure by up to 1.5 years, 35th Ave by 3 years, and Delridge Way by 3 years) will be impacted by multi-year construction and related detours. While tunneling may help reduce the destruction of some homes and businesses, the excavation required for station construction will require very large construction sites with applicable detours.
- Figure 4.2.5-4 does not show any coverings over the station therefore making it appear lower than it is. It only shows the destruction of homes directly adjacent to the station, but not along the guideway which again provides a distorted impression of what will happen.

Rachael Worthington Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Ian Crozier Draft EIS Comment

Manager DEIS Comments,

Good evening. After reviewing the Sound Transit's DEIS materials for The Ballard-West Seattle Link Extension I am writing to submit my comments.

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: Pursue a shallow 5th Ave station. Use project funding to re-locate existing businesses and pay their rent for the duration of the project.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. William White Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Matthew Dockrey Draft EIS Comment

Manager DEIS Comments,

Executive summary: I support everything Seattle Subway has to say on this subject.

We need to think long term and get this right. That means prioritizing good transfers and good station placement. Particularly with the very real possibility of extra funding from a Seattle-only ballot initiative in 2024, this is not the time to cheap out.

Some of the depths for the downtown stations are ridiculous. Please actually consider the perspective of the people who will be using the system!

The recent news of the minimum bridge height set by the Coast Guard provides an excellent opportunity to revisit a Ballard tunnel to 20th, putting the station where it would be the most useful. Have you ever walked from 14th to Ballard proper? It's a pain. We should be reinforcing our existing urban villages, not hoping to recreate them on their outskirts after another decade of development.

This is one of the most important projects currently underway for the future of the region. I implore you to make sure we get it right, while we still can.

Thank you for your time.

Environmental Impact Statements Comments

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement.

Systemwide:

(1) Study Milan method cut and cover within the existing street right of way. (https://pedestrianobservations.com/2021/02/25/cut-and-cover-is-underrated/)

(2) Study full automation. The increase in capacity from operating smaller trains at higher frequency automated operations reduces station size needs (greatly reducing costs) while providing better service. Automated operations also save labor costs.

(3) Review global standards for fire/emergency issues. It's ridiculous a station cannot fit within the 80 ft Fauntleroy due to the local fire code. Sound Transit should plan from the basis of accepted global 'best practice' and seek code changes where they diverge. Updating archaic standards to save hundreds of millions is a no-brainer.

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth means we must build the most comprehensive rail network we can to promote transit-oriented development and decrease vehicle use. Eliminating planned stations is in direct opposition to what the region's voters want and need. Maximizing ridership and long-term growth are the goals. Short-term construction impacts can be mitigated and must not prevent the better options from being selected.

Shallower stations reduce cost, and risk of project delay while promoting shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game-day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Ballard: Study pairing a high bridge with an elevated 15th Avenue station and continue to refine all tunnel options to put a station entrance west of 15th Avenue. Reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.

Interbay: Advance and refine Thorndyke Retained Cut [IBB-2a/IBB-2b] and a slimmed-down 15th Avenue Elevated Station [IBB-3]

Smith Cove: Build the preferred Galer Street Station/Central Interbay [SIB-1].

Seattle Center: Build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.

SLU: Reject both presented options, study a Westlake or similarly north-south aligned station within SLU boundaries and as centered on South Lake Union as possible. Harrison Street is preferred as the 'less bad' option currently under consideration.

Denny: Build Westlake Ave Station [DT-1] to line up with an SLU station on Westlake further north, but update vertical conveyances and aim shallower.

Westlake: Build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.

Midtown: Build the station as shallow as possible, design the station for the surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.

Chinatown/International District: Build the 4th Avenue Shallow Alternative (CID-1a) alignment but please make it shallower. Study making it as shallow as the existing CID station by using a shallow tunnel over the existing Downtown Seattle Transit Tunnel to reach Midtown. The transfers must be quicker than four and a half minutes. Throw out deep tunnel options.

Sodo: Choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.

Delridge: Request a study of improved DEL-6 options that are compatible with the Medium 41st Avenue Tunnel [WSJ-5].

Avalon: Build WSJ-5 with a request to study a refined DEL-6 pairing.

Junction: Build Medium Tunnel 41st Avenue Station [WSJ-5], but study a refined Elevated Fauntleroy Station that would reduce residential displacement and costly property takings.

In order to future proof our growing system, we must design for expandability in fivelocations:

(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

Bergen Schmetzer Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Steven Weiss Draft EIS Comment

Manager DEIS Comments,

Hi! I really want more light rail in Seattle. The planned transportation system was one of the main reasons I moved here 8 years ago, and I've been so happy to see it grow. Please keep adding more light rail and help get rid of gas cars. We need it!

I support Seattle Subway's goals, here's what they have to say:

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

Kimberly Kinchen Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement.

I cannot drive because I never got a driver's license, because I could never afford the cost of buying even a used car, let alone afford the cost of maintaining it. I have lived for three deacdes seeing the results of transit planning that doesn't actually put the mobility needs of people like me first, costing us time, energy, and economic and social opportunity. It's important for me that the system is built out to prioritize riders like me who have historically been put last instead of first. It will be very hard to keep voting for future ST measures if the board continues to make decisions that are confounding and not focused on riders.

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Liam Bradshaw Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.

In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Chris Thompson Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

I look forward to using the light rail to get to Ballard but hope the station plans put an entrance much closer to the historic heart of Ballard than on 15th. I want to use the train for shopping (farmers market) and night life and do not relish the walk from 15th to Ballard Ave. We should not be afraid to make the best possible transportation while we have time to plan and invest, instead of committing to the cheapest option and complaining about ridership and station placement for years to come.

In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.

Colleen Robertson Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need and approved.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past.

It's wildly irresponsible that current/ recently installed escalators are out of commission as much as they are. This makes light rail transit nearly useless for so many people.

Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Michael Calkins EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Joss Steward Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Charlene Kahn Draft EIS Comment

I am writing to voice grave concerns about the ST Light Rail extension proposed for West Seattle. As a 25 year resident of this area, I have come to know the unique challenges West Seattle poses to mass transit design - and the challenges mass transit poses to this neighborhood.

Among the many concerns I have, the biggest relates to Chapter 4: Acquisitions, Replacements and Displacements. The negative impacts by this proposed Light Rail extension would outweigh any benefit and would destroy valuable housing, small business as well as negative impacts on our environment and overall quality of life. There is another alternative that many of our community citizens are advocating and I urge you to do a feasibility study on the Gondola proposal instead. Please see comments below:

Acquisitions, Displacements, and Relocations
Chapter 4.2.1 relates to the devastating impact of various light rail alignments on residences, businesses,
parks, and wildlife. Sound Transit is obligated to minimize such (mandated by DOT section 4(f) for example, see chapter 4.2.18). SkyLink would avoid most of the impact listed in this chapter and therefore the current DEIS fails the “Least Harm Analysis” test in 4.2.18.5.
As stated previously, a 2014 Sound Transit paper on mode choices for the regional transit network said:
“Several of the technologies that have moderate to high HCT capabilities, but are generally less suitable
for Sound Transit, could be considered for some service if that service would operate on principally exclusive rights of-way and is not intended to interline (i.e., share the same tracks) with the light rail ‘spine,’ which extends from Everett to Tacoma, and from Seattle to Redmond.” When Sound Transit
issued the April 7, 2022 Gondola Feasibility Report, it reiterated this statement in dismissing “SkyLink’s”
proposal from consideration. SkyLink is proposing a gondola to serve not as the primary mode of the
regional network but as a feeder from the ST3 designated station locations to the main spine of the light
rail system. An urban gondola could provide the capacity needed, could be constructed with minimal
disruption, displacement, and damage to the environment and established community. Specifically, it
would avoid the following problems caused by proposed light rail alternatives:

- Chapter 4.2.1.3: More than a thousand people may have to find new homes, just as many employees will have to find a new place of employment, many current stores and services may not be available in West Seattle anymore.
- Chapter 4.2.1.7/8 misrepresents the housing situation in West Seattle. While Redfin practically shows NO available home inventory in West Seattle, the DEIS just says: "research indicates that there are adequate opportunities for most residents and businesses to successfully relocate within the project vicinity." It promises relocation assistance but fails to mention that no assistance can help if the renter or homeowner cannot qualify for a new home based on current social status / credit rating. Commercial real-estate is very limited in

West Seattle which mean displaced businesses may have to relocate causing them to lose their customer base and West Seattle residents may have to travel longer distances to get services.

- Chapter 4.2.3.3 includes several pages of huge impacts. It talks about the fact that light rail will destroy businesses, reduce the city’s tax base and may affect tribal fishing rights. It fails to address the social impact for the employees and owners affected by this destruction, many of them small businesses whose livelihood is affected. It does not address the strain on the social services. Even more importantly it does not address the impact to the community which has grown around these services and the businesses and families which will be impacted indirectly. Alki Beach Academy for example provides daycare services to 300 children; affected parents may need to quit their jobs or move elsewhere if they lose affordable daycare.
- Chapter 4.2.4.3 and 4.2.5 fail to address the visual impact of the light rail bridge. No accompanying special renderings other than architectural drawings are provided. Instead, it claims it is “consistent with existing views.” While the existing West Seattle freeway is already an eyesore, it only rises briefly above the West Duwamish waterway whereas the southern light rail bridge alignments will rise up high from the SODO station to cross the freeway and stay high until they meet the top of Pigeon Point. The norther bridge alignment will be only slightly lower. This huge structure will be visible not only from Pigeon Point but all along the Duwamish, Beacon Hill, Georgetown, SODO and even T-Mobile Park. No renderings of this

have been provided. The impact to the Youngstown neighborhood may be even greater. At one point, the elevated guideway will be as high as 150 ft, about twice as high as any existing building in the neighborhood. Due to the height of the structure, rail noise will travel even farther.

- Chapter 4.2.4.4 does not address the fact that West Seattle has already suffered the last two years from the closure of the West Seattle bridge and the construction required for RapidRide-H. Now all major arterials and transit ways to enter the center of West Seattle (see App. N.1-4 Fauntleroy Way partial closure by up to 1.5 years, 35th Ave by 3 years, and Delridge Way by 3 years) will be impacted by multi-year construction and related detours. While tunneling may help reduce the destruction of some homes and businesses, the excavation required for station construction will require very large construction sites with applicable detours.
- Figure 4.2.5-4 does not show any coverings over the station therefore making it appear lower than it is. It only shows the destruction of homes directly adjacent to the station, but not along the guideway which again provides a distorted impression of what will happen.
- Chapter 4.2.5.3.3 fails to mention that Olmsted already suggested to preserve the view from Pigeon Point which any of the southern alignments would destroy, for details: Pigeon Point - West Duwamish Greenbelt – Friends of Seattle's Olmsted Parks (seattleolmsted.org)

Thank you for your review and consideration.

I am writing to voice grave concerns about the ST Light Rail extension proposed for West Seattle. As a 25 year resident of this area, I have come to know the unique challenges West Seattle poses to mass transit design - and the challenges mass transit poses to this neighborhood.

Among the many concerns I have, the biggest relates to Chapter 4: Acquisitions, Replacements and Displacements. The negative impacts by this proposed Light Rail extension would outweigh any benefit and would destroy valuable housing, small business as well as negative impacts on our environment and overall quality of life. There is another alternative that many of our community citizens are advocating and I urge you to do a feasibility study on the Gondola proposal instead. Please see comments below:

Acquisitions, Displacements, and Relocations
Chapter 4.2.1 relates to the devastating impact of various light rail alignments on residences, businesses,
parks, and wildlife. Sound Transit is obligated to minimize such (mandated by DOT section 4(f) for example, see chapter 4.2.18). SkyLink would avoid most of the impact listed in this chapter and therefore the current DEIS fails the “Least Harm Analysis” test in 4.2.18.5.
As stated previously, a 2014 Sound Transit paper on mode choices for the regional transit network said:
“Several of the technologies that have moderate to high HCT capabilities, but are generally less suitable
for Sound Transit, could be considered for some service if that service would operate on principally exclusive rights of-way and is not intended to interline (i.e., share the same tracks) with the light rail ‘spine,’ which extends from Everett to Tacoma, and from Seattle to Redmond.” When Sound Transit
issued the April 7, 2022 Gondola Feasibility Report, it reiterated this statement in dismissing “SkyLink’s”
proposal from consideration. SkyLink is proposing a gondola to serve not as the primary mode of the
regional network but as a feeder from the ST3 designated station locations to the main spine of the light
rail system. An urban gondola could provide the capacity needed, could be constructed with minimal
disruption, displacement, and damage to the environment and established community. Specifically, it
would avoid the following problems caused by proposed light rail alternatives:

- Chapter 4.2.1.3: More than a thousand people may have to find new homes, just as many employees will have to find a new place of employment, many current stores and services may not be available in West Seattle anymore.
- Chapter 4.2.1.7/8 misrepresents the housing situation in West Seattle. While Redfin practically shows NO available home inventory in West Seattle, the DEIS just says: "research indicates that there are adequate opportunities for most residents and businesses to successfully relocate within the project vicinity." It promises relocation assistance but fails to mention that no assistance can help if the renter or homeowner cannot qualify for a new home based on current social status / credit rating. Commercial real-estate is very limited in

West Seattle which mean displaced businesses may have to relocate causing them to lose their customer base and West Seattle residents may have to travel longer distances to get

services.

- Chapter 4.2.3.3 includes several pages of huge impacts. It talks about the fact that light rail will destroy businesses, reduce the city's tax base and may affect tribal fishing rights. It fails to address the social impact for the employees and owners affected by this destruction, many of them small businesses whose livelihood is affected. It does not address the strain on the social services. Even more importantly it does not address the impact to the community which has grown around these services and the businesses and families which will be impacted indirectly. Alki Beach Academy for example provides daycare services to 300 children; affected parents may need to quit their jobs or move elsewhere if they lose affordable daycare.
- Chapter 4.2.4.3 and 4.2.5 fail to address the visual impact of the light rail bridge. No accompanying special renderings other than architectural drawings are provided. Instead, it claims it is "consistent with existing views." While the existing West Seattle freeway is already an eyesore, it only rises briefly above the West Duwamish waterway whereas the southern light rail bridge alignments will rise up high from the SODO station to cross the freeway and stay high until they meet the top of Pigeon Point. The norther bridge alignment will be only slightly lower. This huge structure will be visible not only from Pigeon Point but all along the Duwamish, Beacon Hill, Georgetown, SODO and even T-Mobile Park. No renderings of this have been provided. The impact to the Youngstown neighborhood may be even greater. At one point, the elevated guideway will be as high as 150 ft, about twice as high as any existing building in the neighborhood. Due to the height of the structure, rail noise will travel even farther.

Sarah Dallosto Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Brandon Bowersox-Johnson Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement.

Please make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

Here are specific recommendations that I support:

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: listen to community voices about the loss of historical buildings and businesses! Please throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Brie Gyncild Draft EIS Comment

Manager DEIS Comments,

Like so many others, I'm excited about light rail finally connecting Ballard and West Seattle to other neighborhoods (to MY neighborhood). I appreciate the opportunity to comment on the draft environmental impact statement. It's so important to get this right.

The experience and convenience of riders -- and the potential for ridership growth -- need to be prioritized as we strive to move people out of private vehicles and reduce greenhouse gas emissions -- as well as all the other harms that come from driving.

Continue to move forward with all stations voters approved with ST3 in 2016. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent and reliable escalators and elevators, which has been a huge problem in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. They also need to handle bicycles, assistive devices, and other bulky or oversized equipment well. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth, quick, effortless transfers are essential. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

I join with Seattle Subway in the following requests:

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Samantha Berk Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. Trevor Reed Draft EIS Comment

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement.

Systemwide:

(1) Study Milan method cut and cover within the existing street right of way. (https://pedestrianobservations.com/2021/02/25/cut-and-cover-is-underrated/)

(2) Study full automation. The increase in capacity from operating smaller trains at higher frequency automated operations reduces station size needs (greatly reducing costs) while providing better service. Automated operations also save labor costs.

(3) Review global standards for fire/emergency issues. It's ridiculous a station cannot fit within the 80 ft Fauntleroy due to the local fire code. Sound Transit should plan from the basis of accepted global 'best practice' and seek code changes where they diverge. Updating archaic standards to save hundreds of millions is a no-brainer.

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth means we must build the most comprehensive rail network we can to promote transit-oriented development and decrease vehicle use. Eliminating planned stations is in direct opposition to what the region's voters want and need. Maximizing ridership and long-term growth are the goals. Short-term construction impacts can be mitigated and must not prevent the better options from being selected.

Shallower stations reduce cost, and risk of project delay while promoting shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game-day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Ballard: Study pairing a high bridge with an elevated 15th Avenue station and continue to refine all tunnel options to put a station entrance west of 15th Avenue. Reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.

Interbay: Advance and refine Thorndyke Retained Cut [IBB-2a/IBB-2b] and a slimmed-down 15th Avenue Elevated Station [IBB-3]

Smith Cove: Build the preferred Galer Street Station/Central Interbay [SIB-1].

Seattle Center: Build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.

SLU: Reject both presented options, study a Westlake or similarly north-south aligned station within SLU boundaries and as centered on South Lake Union as possible. Harrison Street is preferred as the 'less bad' option currently under consideration.

Denny: Build Westlake Ave Station [DT-1] to line up with an SLU station on Westlake further north, but update vertical conveyances and aim shallower.

Westlake: Build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.

Midtown: Build the station as shallow as possible, design the station for the surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.

Chinatown/International District: Build the 4th Avenue Shallow Alternative (CID-1a) alignment but please make it shallower. Study making it as shallow as the existing CID station by using a shallow tunnel over the existing Downtown Seattle Transit Tunnel to reach Midtown. The transfers must be quicker than four and a half minutes. Throw out deep tunnel options.

Sodo: Choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.

Delridge: Request a study of improved DEL-6 options that are compatible with the Medium 41st Avenue Tunnel [WSJ-5].

Avalon: Build WSJ-5 with a request to study a refined DEL-6 pairing.

Junction: Build Medium Tunnel 41st Avenue Station [WSJ-5], but study a refined Elevated Fauntleroy Station that would reduce residential displacement and costly property takings.

In order to future proof our growing system, we must design for expandability in fivelocations:

(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

Austin Skondre Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Ian Brown Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

Ron Davis Draft EIS Comment

Manager DEIS Comments,

I am writing to submit my comments to Sound Transit's Draft Environmental Statement on the Ballard-West Seattle Link Extension.

The current plan does not put riders and increasing ridership first. It must. We did not pass a tens of billions of dollars pan so Sound Transit could build stations with difficult, unreliable transfers, or in the middle of industrial areas.

First, do not cut any of the stations from the ST3 list approved by voters in 2016. I was on the Sound Transit Citizen Oversight Panel - I have seen firsthand how some of the most senior executives in Sound Transit use "voter approval" requirements to protect foolish projects they want to keep, like parking garages. If you want the confidence of the voters and the riders, you dare not set aside something as fundamental as our station choices, lest you show yourself hypocritical.

This is all for good reason. We know the region has experienced explosive growth, far beyond projection, that most of our emissions are from transportation, and that this is the biggest tool we currently have for reducing emissions. Eliminating stations would not only fly in the face of voter expectations, but it ignore the basic needs of our region and environment.

Next, the many of the transfers at the stations are problematic. In part, this is due to the large number of deep stations. Riders must come first, prioritizing short travel times, accessibility and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters.

In fact, ignoring the experience of short-trip, urban riders, particularly in spots like the international district, is a serious assault on equity, showing Sound Transit's continuing indifference to people who don't and earn like their senior staff members. The history of cities and planning agencies, including sound transit, glossing over equity concerns is morally appalling and embarrassing. Let's get it right this time.

Next, if there absolutely must be any deep stations, the vertical experience needs to be substantially better than it is currently in your other stations. There must be enough capacity and redundancy (please stop with the single points of failure) for rushes and crush periods, including big stuff like game days and concerns.

Elevators should go directly to the platform level, multiple should be callable at once, and they should have plenty of excess capacity and redundancy. Escalators should not be involved in deep stations and frankly, generally not relied upon, given ST's long inability to manage them.

All should be built to aggressively minimize time to transfer or board, and to significantly reduce variance on this too. Even Short boardings, when unreliable, are a serious problem for people who need to plan around transit and transfers.

In general, short and smooth transfers have been given short shrift in the DEIS. It continues to feel like ST designs with the mindset of rail as a nice-to-have augmentation for the real stuff that happens in cars and parking garages. This is unacceptable in a city that is going to drastically grow but cannot handle more car trips, that wants to increase its quality of life and wants to reduce its carbon impact.

Transfers must feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel. Specific transfers comments

-In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.

-In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.

-In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].

-At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.

-In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.

-At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.

-At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.

-In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.

-In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.

-In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.

-In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the agency and the DEIS must set up Sound Transit for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to enable a growing future for our system and avoid locking in limited reach, we must we must design with near-readiness to expand in four key spots:

(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).

(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).

(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.

(4) Midtown must be designed to accommodate future expansion to the east along Madison St.

(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you. Please don't let us down.

In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

David Guilland Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:

Gary Lai Draft EIS Comment

I am writing because I do not believe the Draft EIS for West Seattle Light Rail adequately captures the carbon footprint of the project, or addresses alternatives to that footprint. It also does not clearly state the true cost of traffic reduction associated with construction and ongoing operations compared to alternatives.

ENVIRONMENTAL IMPACT COMMENTS
Chapter 1.2.2.6 points out the need to reduce vehicle miles by 30 percent by 2035. However light rail will not connect West Seattle to the SODO light rail station until 2032 and won't be extended farther until at least 2037. That won't provide much incentive for drivers to switch to public transit (as stated in Table 4.2.6). Even after 2037 the expected savings in vehicle miles are minuscule while there will be a large carbon impact caused by the construction that is not captured in the document. Light rail's carbon footprint should be considered, and a proper (outside expert) study done to compare an aerial gondola alternative and light rail carbon footprints in construction and operation.

Appendix L4.6 references carbon consumption, citing that "general FTA estimates" were applied. However, no federal project has ever been as large as the 2+ mile, 8 to 16-story tall elevated light rail guideway planned for West Seattle. Energy consumption during construction was not even considered. (Chapter 4.2.10 says "The FTA Greenhouse Gas Emissions Estimator was not used.") Therefore, the carbon figures for the elevated alternatives will be much higher than general FTA estimates. A proper impact evaluation for various alignments and possible other modes, such as bus and gondola, would involve using tools such as the Embodied Carbon in Construction Calculator (EC3) (developed by the nonprofit, Building Transparency) and be conducted in close consultation with objective environmental science organizations like the Carbon Leadership Forum (CLF), a nonprofit, industry-academic organization at the University of Washington. Calculations also need to account for any displacement of existing structures which ultimately have to be replaced in some way.

Chapter 4.2.6.3 fails to explain why a reduction of 400 trips on the West Seattle bridge (see Table 2-9 of App. N) would contribute to savings of 117,000 miles per day in the region. That would be 293 miles per trip per day which is nonsensical.

Even if calculations were accurate, the construction related carbon as estimated in Appendix L4.6D is between 158,067 and 614,461 tons, and the regional, annual carbon reduction from vehicles (Table 4.2.6-2) 10,941 tons once the light rail connects directly downtown in 2037 as the earliest. Approximately a third of this would be attributable to West Seattle. It may take between 42 to 168 years to offset the West Seattle light rail construction related carbon emissions. Since the light rail construction carbon footprints are underestimated, the payback is even longer.

The DEIS fails to mention that a gondola could provide reliable, grade separate public transit a decade earlier than light rail while generating substantially fewer greenhouse gases during construction. That would significantly contribute to meeting the goal for 30% reduction by 2035. A direct comparison of the carbon footprints and offsets of alternatives should be performed.

PROJECT FUNDING/COST COMMENTS
Chapter 2.8.2.1.1 lists the many alternatives contemplated in the DEIS and the associated total costs between $3 billion and $4.7 billion which is about double or triple the amount approved by voters in ST3 ($1.7 billion). Before the pandemic, three West Seattle buses (RapidRide-C, #121, #21) already provided

25,500 trips daily. The DEIS projects 27,000 trips on light rail by 2042, only 1500 more than buses were providing in early 2020. There will be little improvement in travel time for many riders, given the likely need to take a bus to a West Seattle light rail station and then disembark at SODO and wait for another light rail train to go anywhere else for at least the next 15 years.

Table 2-9 of App. N indicates Sound Transit estimates light rail to reduce 400 vehicle trips on the West Seattle Bridge by 2042. At a light rail cost of almost $10 million per additional daily trip (plus the building of additional operating capacity and train acquisition) and an annual operating cost of $35 to $40 million this investment does not seem worthwhile.

Gondola technology has been proposed by citizens since 2015 but always ignored or dismissed as incapable of serving regional transit needs despite the fact that it is being suggested, not as a regional mode, but as a high-capacity feeder for a densely developed terrain with hills and water obstacles where light rail is difficult, expensive, and damaging to build. Other light rail corridors such as from SODO to Georgetown/South Park could provide a more economical way (both in construction and annual operation) to provide light rail to the Duwamish peninsula.

Ian Brobin Draft EIS Comment

Manager DEIS Comments,

I am writing to echo the sentiments listed below by Seattle subway. In particular, I think the super deep system is a bad idea as it will make the light rail much harder to use and add tons of upkeep cost with maintaining an elevator. I also think it would be great to have an extension to Freemont!

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Anshum Gupta Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.

(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Kelly Brown Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

Mike Orr Draft EIS Comment

Manager DEIS Comments,

My comments on the Ballard-West Seattle Link Draft Environmental Impact Statement.

Slow down the EIS and consider more rider-friendly, pedestrian-friendly, and lower-cost alternatives. When we voted for ST3 there was no inkling that the downtown stations would 100 feet deep or more, require several minutes to transfer between trains, or that Ballard Station might be east of 15th Ave NW, or that the system would cost so much. This requires a rethink and a wider range of solutions.

The hallmark of a good metro network is short train-to-train transfers so that riders can access the entire network easily, but the alternatives in the DEIS are the opposite, making it an ordeal to transfer and ride one or two stations more, or from the Eastside to the airport. Don't choose an alignment that fails at its primary purposes.

If the downtown stations can't be moved closer to the existing platforms and to the surface, and if they will cost so much more to build than expected, then it's time to consider alternatives to the second tunnel. Several come to mind:

(A) improve the existing tunnel to increase frequency from 3 minutes to 1.5 minutes.
(B) interline Ballard/SLU into the existing tunnel.
(C) terminate Ballard/SLU at Westalke until a better downtown solution can be found.
(D) build an inexpensive cut-and-cover tunnel under 5th Avenue or elsewhere.
(D) swing downtown segment further east to transfer at Capitol Hill instead of Westlake and serve First Hill
(E) consider BRT alternatives for West Seattle and Ballard.

Improving the existing tunnel is feasible; Sound Transit considered it in the run-up to ST3. Without the large cost of the second tunnel, there would be plenty of money to improve the first tunnel and service to West Seattle and Ballard.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Take another look at a 20th Ave NW station in Ballard. That has the best walkshed for the urban village, which is centered between 17th and 22nd. The representative alignment at 15th is already at the eastern edge of the village and a significant walk to most of the busineses and apartments. 14th would be unprecedentedly worse, and the east side of 14th even worse than that. There's a saying now: "14th doesn't serve Ballard the same way International District/Chinatown Station doesn't serve Westlake." They're both the same distance, yet Westlake has its own station and there are two more stations between it and International District/Chinatown. Yet people are supposed to walk that distance from Ballard station to Ballard proper? On paper it sounds like 14th or 15th is close to 17th or 20th, but the distance between 14th and 15th is unusually wide, more like three blocks instead of one.

For West Seattle, BRT was always a better idea. West Seattle's steep hills make it difficult to get from one part of it to another, so travel tends to be in isolated north-south corridors. The Link plan would connect three of those to downtown (California Ave SW, 35th Ave SW, and Delridge Ave SW). But only a tiny part of those areas are within walking distance of Link, and only one of them has an urban village at the station. Most West Seattle residents will have to transfer from a north-south bus to Link, and both segments of the transfer are rather short. It would be better to have BRT fanning from the Westlake Bridge to all of those corridors both north and south.

Consider putting Link on Fauntleroy Way SW in West Seattle. That would cost less than the current alternatives, minimize property takings, and maximize the number of destinations within walking distance. Fauntleroy is a wide arterial through the middle of Link's coverage area, and the destinations are either right on it or a block or two away.

Establish a riders' review board alongside the stakeholders review board and the electeds review board. Riders' concerns aren't getting enough consideration.

In SLU: Reject both presented options, study an alignment on Westlake Ave N or similar, oriented north-south in the village. That would better serve the many highrises and pedestrian destinations

throughout SLU. It would be less expensive than tunneling around the Highway 99 tunnel entrance.

The Harrison station location on Aurora Ave N is not as useful as it seems. People traveling on the RapidRide E bus line would likely stay on the bus one more mile to get downtown, and that bus segment is reasonably fast. Likewise, people coming from the south end to Aurora can transfer to the E just as easily downtown as at Harrison. It would be better to serve the thousands of pedestrians in SLU than a few hundred RapidRide E riders who probably won't transfer there anyway.

In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.

Look at train-to-train transfers in SODO. That could be an attractive alternative to avoid the deep stations and long transfer distance downtown.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.
(6) Plan to extend the Ballard line towards Greenwood, Lake City, and Kenmore.

Christian Roach Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. Please prioritize long-term benefits to riders over short-term disruptions and costs. In particular, keep stations shallow, optimize placement for convenient access and transfers, and design in options for future expansion. Short-term construction impacts should play very little role in the decisions.

In short, follow Seattle Subway's recommendations: https://seattletransitblog.com/2022/04/13/seattle-subways-summary-recommendations-for-the-st3-deis/

Communication (4/28/2022)

Re: Chapter 2:
The West Seattle-Ballard Link Extensions must put riders and increased ridership first.

Stations should be as shallow as possible to minimize total travel times and improve accessibility and reliability. Many of the proposed station depths, especially at the Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are common for the large number of riders who are not suburban commuters.

Any deep high capacity stations must have significant capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure.

Elevators should go from the street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Section 2.1.2.2.1
Prefer the Mixed Profile Alternative (SODO-2) - bias for supporting improved frequency and reliability. Study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility (re page 6-5).

Section 2.1.2.2.2
In Chinatown/International District, reject any deep stations and study shallower 4th avenue stations, similar to Option CID-1a. As a critical regional transportation hub, transfer times must be optimized

Section 2.1.2.2.3
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.

At Westlake, build 5th Ave Station [DT-1], but update the elevator and escalator plan (Appendix J, pg 173 / B05-ASX100) to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.

At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.

At South Lake Union Station: Reject both presented options, study a Westlake Avenue or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible. The presented options are too close to the SR99 interchange which is a pedestrian hostile environment and too far from neighborhood centers of activity.

At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

Andrew Stephenson Draft EIS Comment

Manager DEIS Comments,

My name is Andrew - a transportation engineer from Seattle, working in South King County, living in North King County. I depend on Seattle's public transit and use it every week, although often work remotely. I would like to share my comments to submit to Sound Transit's Draft Environmental Statement

My experience and comments not only from from my professional experience as a transportation engineer, but I have also lived in Japan and France for several years without a car, where public transportation is extremely convenient, very low effort to use, and easy to navigate for an English-speaker. There are no excuses for Seattle - we should be modeling our system by foreign examples who have been solving problems for over two centuries... since before Seattle was founded.

When I use Seattle's light rail, I've noticed some very alarming issues that seem easily avoidable by simply traveling to Europe and Asia with open eyes. Of course, it would be better to professionally consult with European and Asian transportation systems. It's so disappointing that Sound Transit has so many problems with its current system despite it being such an old technology already near-perfected by parts of Europe and Asia.

Firstly, here are my comments about the current system, and I continue below with my comments about the Ballard-West Seattle Link Extension.

-Deep stations are inconvenience and miserable for access, making every journey less than ideal; They should only be used for low ridership stations.
-Stations without numbers are terrible for non-English speakers... the cute logos of animals and ships are only art, not helpful tools. Remove them and upgrade Sound Transit a professional transit system to serve the riders, not just tourists.
-Quiet stations are uncomfortable and make for unpleasantness; Urban and rural stations need artificial sounds - Japan uses pleasant bird sounds and soft bell chimes that occasionally cut the silence.
-Empty stations are unpleasant; Fill the urban stations with convenience stores, eateries, and other location opportunities for business owners.
-Gate turnstiles! When I first rode light rail in 2009, I shook my head at the lack of gates or turnstiles. I wondered how long that would last before Sound Transit understands why nearly all metro systems use turnstiles. And now I see in the news that people aren't paying their fares. Now do you get it?
-Low floor cars are for streetcars. I look forward to when Sound Transit promotes its giant regional streetcar system (link light rail) to a heavy rail system to take seriously, with standard high-floor train cards for higher speeds and capacity.

Regarding my comments to the Ballard-West Seattle Link Extension, it must put riders and increased ridership first.

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.

Claire Taylor Draft EIS Comment

Manager DEIS Comments,

In short: please listen to Seattle Subway's advocacy. Prioritize long-term system excellence in station/transfer/routing design. These tracks aren't going anywhere anytime soon so get it right the first time.

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who live and work near the Seattle Core. I will use the system less if you make transfers expensive.

It's also impossible to believe that SoundTransit will maintain deep stations' elevators/escalators to acceptable standards based on past performance.

If deep stations are an absolute must (which they aren't), ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:

Charlie Hamilton Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Robin Briggs Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. This is an imperative for the climate, and it will also make our city much more livable. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

Owen Phillips Draft EIS Comment

Manager DEIS Comments,

Hello Sound Transit,

My name is Owen Phillips. I've been a Seattle resident since 2019, and I am writing to submit my comments to Sound Transit's Draft Environmental Statement. The Ballard-West Seattle Link Extension must put riders and increased ridership first.

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

Steven Stroiney Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Douglas Hamlin Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.

Alex McGuire Draft EIS Comment

Manager DEIS Comments,

Hello, I hope these are concise and to the point but at the end of everything the Ballard-West Seattle Link Extension must put riders and increased ridership first.

Your target should be to build a solution that would help a single parent who speaks English as a second language, has a bad back, and is holding down 2 part-time jobs.

- We must not eliminate ANY stations from what voters approved with ST3 in 2016. If planned stations are removed, that is in direct opposition to what the region's voters want and need.
- All stations should be built as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters.

-Deep and high-capacity stations also call for excellent vertical conveyances, which is proven to have not been a priority in the past. This pattern has to be broken. Elevators and escelators cannot fail riders or trap them from alternatives in the event of mechanical failure.

- Creating large capacity areas other than elevators will allow optimal use of the elevators by less physically able-bodied individuals, allowing them to still use our transit to the fullest extent. Ensure escalators and elevators are both fast while having enough capacity and redundancy to handle traffic like game-day rushes.
- Elevators should go from street level straight to the platform level, without mezzanines to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.
- Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.
- In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment. If we are to anticipate expanding our transit system off of this current expansion, we need a better and more flexible solution.
- In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
- In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
- At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible. The organizations here have had to deal with quite a bit of disruption from the pandemic and Climate Arena's construction, and additional disruption and impacts should be heavily weighed and avoided when possible.
- In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible. This will allow better expansion opportunities and quicker transfers which will increase usage.
- At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower. Having to navigate 3-4 different mezzanines to reach your
- At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
- In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
- In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
  In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
- In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

Greg Pieczynski Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub. 5th Avenue station options also seem to be detrimental to the neighborhood for many years and too many businesses affected. 4th Ave may be more expensive but it would be the better path forward. International district will end up being the MOST critical and used station as it is central to ALL transit as well as huge sporting events. International district has to be prioritized and done right!
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Katherine Dee Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement. West Seattle has been desperate to connect with the rest of the city and after 2 years without our bridge we are suffering both personally and for our small businesses.

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

As a resident of West Seattle myself, these last few stations are of particular importance to me. Creating practically designed and carefully located stations to support the highest ridership levels possible is what will most benefit the neighborhood long term.
Moreover, overall, Sound Transit must prioritize the rider's experience whenever possible, by keeping stations from going massively deep, and by making transfers from one line to another as quick and seamless as they can be.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Michael Barrows Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Charles Tishman Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

Kathy Qin Draft EIS Comment

Manager DEIS Comments,

The station should be closer to the core of Ballard. With the changes to the height requirements for the bridge it makes sense.

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

Matt Brannock Draft EIS Comment

Manager DEIS Comments,

My summary: please listen to Seattle Subway's advocacy. Prioritize long-term system excellence in station/transfer/routing design. These tracks aren't going anywhere anytime soon so get it right the first time.

=======

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who live and work near the Seattle Core. I will use the system less if you make transfers expensive.

It's also impossible to believe that SoundTransit will maintain deep stations' elevators/escalators to acceptable standards based on past performance.

If deep station are an absolute must (which they aren't), ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. In fact, the state legislature just passed SSB 5528, which will allow cities like Seattle to expand the rapid transit network, benefiting our whole region's mobility.

In order to future proof our growing system, we must design for expandability in four locations:
(1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
(2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
(3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
(4) Midtown must be designed to accommodate future expansion to the east along Madison St.
(5) West Seattle should be built for future southern expansion to White Center and Burien.

Benjamin Rogers Draft EIS Comment

Manager DEIS Comments,

The Ballard-West Seattle Link Extension must put riders and increased ridership first. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

Do not eliminate any stations from what voters approved with ST3 in 2016. The region's projected growth and increasing carbon emissions from the transportation sector mean we must build the most comprehensive rail network we can. Eliminating planned stations is in direct opposition to what the region's voters want and need.

Make stations as shallow as possible to promote shorter travel times, accessibility, and reliability. The proposed station depths and access plans, especially for the Midtown, Westlake, Denny, and Seattle Center stations will increase travel times too much to be useful for short trips, which are essential for the large number of riders who are not suburban commuters. Any deep and high-capacity stations also call for excellent vertical conveyances, which has not been a priority in the past. Ensure escalators and elevators are (1) fast and (2) have enough capacity and redundancy to handle game day rushes and not fail riders in the event of mechanical failure. Such elevators should go from street level straight to the platform level, without any mezzanines in order to deliver passengers to trains as quickly as possible without creating additional time and accessibility penalties.

Smooth transfers between the system's growing lines is paramount to promoting a healthy rail system. In order to make transit the primary mode of transportation for all members of our communities, we need quick transfers that feel effortless. Wherever possible, plan for shorter transfers that minimize walking time and vertical travel.

In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

Finally, the DEIS should position Sound Transit to plan for future expansion in Seattle. ST3 is a fantastic addition to our regional system, but will not be the end of rail expansion in Seattle. Austin Johnson Draft EIS Comment

General Comments

Tunnel options are preferred, especially in light of recent legislation allowing for local funding mechanisms; Seattle residents will pay additional costs to “build it right” with tunnel options being the clear preference for a 100+ year investment.

Build for pedestrian priority. Adding several blocks from stations to core areas will reduce ridership.

It’s imperative that we plan for continued expansion of the system. The final deliverables must support extensions from Alaska Junction to White Center/Burien, from South Lake Union north via Aurora, and from Ballard north/east to Crown Hill (and beyond) or Wallingford (and beyond).

Station Specific Comments

For Alaska Junction: Prefer Medium Tunnel 41st Avenue Station [WSJ-5], but study a refined Elevated Fauntleroy Station that would reduce residential displacement and costly property takings.

For SoDo: Choose Mixed Profile Station [SoDo-2] and study siting further north at the existing SoDo Station location to avoid costly post office taking. Eliminate wide-ranging pedestrian bridges (i.e., Northgate) in favor of compact station design with quick routes to surface streets. Prioritize maintaining the SoDo Busway (after construction is complete)

Chinatown-International District: 4th Avenue is the best option to minimize disruption to businesses. Study making it as shallow as the existing CID station by using a shallow tunnel over the existing Downtown Seattle Transit Tunnel to reach Midtown. The transfers must be quicker than four and a half minutes. We need ease of connection between lines, Sounder, Amtrak and busses. Study utilizing the existing Union Station as this is a regional community asset that could be re-tooled to again be used for transit. Prioritize direct payments to impacted local businesses to offset loss in customer traffic during construction. We can pay these businesses’ rental and operating costs during the construction period cheaper than we can build deeper, more elaborate tunnels, and with a 100+ year investment window, we need to build the tunnel correctly.

Midtown station – the deep tunnel is not very workable. Difficult transfers and access between stations artificially depresses ridership. Again, stressing that these are multigenerational investments and we need to do them correctly. Make the station as shallow as possible, design the station for surface-to-platform elevators eliminating mezzanine transfers.

Westlake/5th Ave station – This looks to be the busiest station in the entire system. Update the elevator and escalator plan to improve ease of use and redundancy and find ways to speed up transfers and surface access.

Denny: Prefer DT-1 on Westlake Avenue. Interruptions to streetcar are not that important (low ridership), especially since Center City Connector is not guaranteed. Bus detours via adjacent streets is possible. Aim for shallower and more direct station with access on Westlake Ave. Also, do not consider eliminating either this (Denny) or the next (SLU) station – we need both as this is a dense and growing area of the city.

SLU Station: move this station away from SR-99 to maximize the residential population in the walkshed. This isn’t suburban Snohomish County, we need to place transit stations in the neighborhoods where people actually live – and no one lives atop SR-99.

Seattle Center – prefer Republican Street. Mitigate impacts to arts organizations, preserving them on-site, increase mitigation efforts as well via enhanced landscaping

Smith Cove – maintain, do not eliminate, this station. Prefer elevated Galer Street station as it offers good connections to Expedia and South Magnolia.

Interbay - Advance and refine Thorndyke Retained Cut [IBB-2a/IBB-2b] and a slimmed down 15th Avenue Elevated Station [IBB-3].

Ballard – advance and continue study of tunnels; again, this is a 100+ year investment and we need to pass local-option funding mechanisms that allow Seattle residents to pay additional dollars to build a Ballard tunnel. Continue studying 20th Avenue NW station costs as this is much closer to the core of Ballard and will likely increase appeal and ridership. Out of the existing, presented options, 15th Ave is preferred. The line needs to be built with expansion in mind, and the 14th Ave option would be difficult to extend north due to Ballard High School. Design Ballard station for future extensions north to Crown Hill or Greenwood and east to Wallingford / U District. Finally, a movable bridge should be eliminated as an option due to possible future constraints on the system.

Lyndon Judge Draft EIS Comment

Manager DEIS Comments,

I am a Ballard homeowner and daily transit user and I'm writing to ask Sound Transit to put riders first in the design of the Ballard-West Seattle Link Extension. I am writing to submit my comments to Sound Transit's Draft Environmental Statement

1. Do not eliminate any stations from the voter approved ST3 plan. Doing so would break trust with voters and hurt the ability of Link to meet our future transit needs.

2. Make stations as shallow and easily accessible as possible to promote shorter transit times and easier bus transfers. As a city dweller, the light rail is most useful to me for short trips and I'm concerned that excessively deep stations will decrease the utility of Link for short trips due to excessive time required to reach the platform.

3. Prioritize escalators and elevators that work quickly and reliably. Sound Transit has a terrible recent track record on this which is already impacting usability of the newest Link extension. Failing to remedy these problems will have a long lasting effect on Link ridership.

4. Prioritize short transfer times that minimize walking and vertical travel. In particular:
   In Ballard: reopen additional study of 20th Avenue Station/Thorndyke Tunnel Portal alignment.
   In Interbay: build Thorndyke Retained Cut [IBB-2b] for a tunnel to Ballard.
   In Smith Cove: build the preferred Galer Street Station/Central Interbay [SIB-1].
   At Seattle Center: build the Republican Street Station and work to mitigate impacts to arts organizations as much as possible.
   In SLU: Reject both presented options, study a Westlake or similar alignment oriented north-south within SLU boundaries and as centered on South Lake Union as possible.
   At Denny: build Westlake Ave Station [DT-1] to line up with a SLU station on Westlake further north, but update vertical conveyances and aim shallower.
   At Westlake: build 5th Ave Station [DT-1], but update the elevator and escalator plan to improve ease of use and redundancy and additional find ways to speed up transfers and surface access.
   In Midtown: build the station as shallow as possible, design the station for surface to platform elevators, build in ample elevator redundancy, and use modern interfaces to ensure nearly seamless elevator use.
   In Chinatown/International District: throw out deep stations and open additional study for a shallower station on 4th Avenue, similar to option CID-1a, to improve transfer times at this critical regional transportation hub.
   In Sodo: choose the Mixed Profile Station [SoDo-2] and study construction further North, at the existing SoDo Station location to save the SoDo busway and avoid the Post Office's facility.
   In West Seattle, Avalon, and Delridge: build WSJ-5 and study a better Avalon station to allow better options than DEL-6 next to a cement plant but connect Delridge to WSJ-5.

5. Plan to accommodate future growth and expansion of Link beyond ST3.
   In order to future proof our growing system, we must design for expandability in four locations:
   (1) South Lake Union must be designed to accommodate future expansion to the north (up SR-99/Aurora) and to the east (replacing the King County Metro 8 line).
   (2) Ballard station must be built for expansion toward the north (Crown Hill/Greenwood/Lake City) and to the east (Ballard/UW).
   (3) The new SoDo station must allow for future expansion south to Georgetown, South Park, SeaTac, and Renton.
   (4) Midtown must be designed to accommodate future expansion to the east along Madison St.
   (5) West Seattle should be built for future southern expansion to White Center and Burien.

Thank you for your review of these comments.

Transitional Resources Form Letter

Many of the people Transitional Resources serves will be irrevocably impacted by the proposed alternative routes outlined in DEL-5 and DEL-6 if these options move forward.

The planned route for DEL-5 and DEL-6 would directly impact three of Transitional Resources' properties and would devastate the vital services TR provides to the community. Without these services or programs, the people who live in the buildings—as well as those who receive services from the buildings--would be displaced and/or disconnected from the services they need. The loss of these critical services in our community would be devastating to not only the clients they serve, but to our larger community, as finding alternative housing and services that address the unique needs of the populations they serve in the same way TR does would be challenging.

As someone who cares deeply about our community and the nonprofits that provide support to those in need, I strongly urge Sound Transit to reject both the DEL-5 and DEL-6 alternative proposals.

Your opposition to Alternatives DEL-5 and DEL-6 has been noted. Sound Transit acknowledges the inconvenience and hardship of relocating residences and services for the population you serve. Please see the mitigation section in Section 4.1, Acquisitions, Displacements, and Relocations, of the West Seattle Link Extension Final EIS for more information on support Sound Transit would provide to help find new homes or sites, solve problems that might occur, and plan for relocation. Please see responses to CCG2, CCG3, CC4.1a, CC4.1d, and CC4.4d in Table 7-1 in Chapter 7, Comment Summary, of the Final EIS.

Communication (4/22/2022)

I am writing to comment on the proposed Delridge segment of the West Seattle Link Extension plan. I strongly oppose the DEL-5 and DEL-6 proposals of Sound Transit's light rail plan, as it would devastate a nonprofit that provides services to our community's most vulnerable people.

Transitional Resources is a community behavioral health agency located in West Seattle on SW Avalon Way. They serve vulnerable adults from all over King County who are living with serious mental illness and provide them with behavioral health treatment and supportive housing services, ensuring these folks remain safe, healthy, and housed. Transitional Resources has multiple properties and serves a multitude of people who live in various parts of West Seattle, but a majority of whom are within very close proximity to their offices located on SW Avalon Way. Many of the people Transitional Resources serves will be irrevocably impacted by the proposed alternative routes outlined in DEL-5 and DEL-6 if these options move forward.

The planned route for DEL-5 and DEL-6 would directly impact three of Transitional Resources' properties and would devastate the vital services TR provides to the community. I am writing to comment on the proposed Delridge segment of the West Seattle Link Extension plan. I strongly oppose the DEL-5 and DEL-6 proposals of Sound Transit's light rail plan, as it would devastate a nonprofit that provides services to our community's most vulnerable people.

Executive Summary:
If those proposals are implemented, one of Seattle's most effective organizations helping people with serious mental illness stay safe, healthy and housed will have its support services seriously disrupted. The organization is Transitional Resources. Offering housing, health care and professional support to hundreds of individuals, using several properties (many of them shared homes clustered around the main building from which staff work), Transitional Resources is able to deliver services to these vulnerable people that make the different between their falling into deep trouble, and having a stable and often productive life. The proposed routes DEL-5 and DEL-6 will affect three TR properties and put physical barriers between buildings in this community, disrupting services. It would be a devastating blow.
This would affect not only the clients of TR, but also the greater Seattle community where services like those TR provides are sorely needed.

Please Read On

Communication (4/23/2022)

I am writing to comment on the proposed Delridge segment of the West Seattle Link Extension plan. I strongly oppose the DEL-5 and DEL-6 proposals of Sound Transit's light rail plan, as it would devastate a nonprofit that provides critical services to people living with disabilities.

Transitional Resources is a community behavioral health agency located in West Seattle on SW Avalon Way. They serve adults from all over King County who are living with serious mental illness and provide them with behavioral health treatment and supportive housing services, ensuring these folks remain safe, healthy, and housed. Transitional Resources has multiple properties and serves a multitude of people who live in various parts of West Seattle, but a majority of whom are within very close proximity to their offices located on SW Avalon Way. Many of the people Transitional Resources serves will be irrevocably impacted by the proposed alternative routes outlined in DEL-5 and DEL-6 if these options move forward. They will lose their housing and the critical behavioral health services that support them in staying safe, stable, and housed.

The planned route for DEL-5 and DEL-6 would directly impact three of Transitional Resources' properties and would devastate the vital services TR provides to the community. Without these services or programs, the people who live in the buildings—as well as those who receive services from the buildings--would be displaced and/or disconnected from the services they need. The loss of these critical services in our community would be devastating to not only the clients they serve, but to our larger community, as finding alternative housing and services that address the unique needs of the populations they serve in the same way TR does would be challenging.

As someone who cares deeply about increased pubic transit as well as the nonprofits that provide support to those in need, I strongly urge Sound Transit to reject both the DEL-5 and DEL-6 alternative proposals.

FWIW: I'm an avid supporter of Link and love riding it. I got up early on the first day it opened to Northgate just to take the trip. I want more Link to more destinations as fast as you can build it.

With that said:

Communication (4/26/2022)

The planned route for DEL-5 and DEL-6 would negatively and directly impact three of Transitional Resources' properties and would devastate the vital services TR provides to the community. We're talking housing and services for chronically homeless folks with serious mental illnesses! Without these services or programs, the people who live in the buildings—as well as those who receive services from the buildings--would be displaced and/or disconnected from the services they need. The loss of these critical services in our community would be devastating to not only the clients they serve, but to our larger community, as finding alternative housing and services that address the unique needs of the populations they serve in the same way TR does would be challenging. Our son lives with us now, but we are looking to TR housing for the future for him.

As someone who cares deeply about our community and the nonprofits that provide support to those in need, I strongly urge Sound Transit to REJECT both the DEL-5 and DEL-6 alternative proposals.

Communication (4/26/2022)

I am writing to comment on the proposed Delridge segment of the West Seattle Link Extension plan. I strongly oppose the DEL-5 and DEL-6 proposals of Sound Transit's light rail plan, as it would devastate a nonprofit that provides services to our community's most vulnerable people.

Transitional Resources is a community behavioral health agency located in West Seattle on SW Avalon Way. They serve vulnerable adults from all over King County who are living with serious mental illness and provide them with behavioral health treatment and supportive housing services, ensuring these folks remain safe, healthy, and housed. Transitional Resources has multiple properties and serves a multitude of people who live in various parts of West Seattle, but a majority of whom are within very close proximity to their offices located on SW Avalon Way. Many of the people Transitional Resources serves will be irrevocably impacted by the proposed alternative routes outlined in DEL-5 and DEL-6 if these options move forward.

The planned route for DEL-5 and DEL-6 would directly impact three of Transitional Resources' properties and would devastate the vital and integrated services TR provides to the community. Without these services or programs, the people who live in the buildings—as well as those who receive services from the buildings–would be displaced and/or disconnected from the services they need. The loss of these critical services in our community would be devastating to not only the clients they serve but to our larger community, as finding alternative housing and services that address the unique needs of the populations they serve in the same way TR does would be challenging.

There is a crisis right now in mental health care and a large demand for the services TR provides. Uprooting the critical programs that they provide, as well as displacing the individuals they serve when the demand is already high, would put unnecessary pressure on the system. The results could be catastrophic, both to our clients and to the community at large.

As someone who cares deeply about our community and the nonprofits that give to those in need, I strongly urge the committee to reject both the DEL-5 and DEL-6 alternative proposals.

Communication (4/27/2022)

I am writing to comment on the proposed Delridge segment of the West Seattle Link Extension plan. I want to express my strong opposition to the DEL-5 and DEL-6 proposals of Sound Transit's light rail plan, as it would cripple and perhaps even effectively end the operations of Transitional Resources, a nonprofit that provides services to our community's most vulnerable people.

Transitional Resources ("TR") is a community behavioral health agency located in West Seattle on SW Avalon Way. For nearly a half century, TR has developed successful programs and housing to serve vulnerable adults from all over King County. These vulnerable citizens are living with serious and persistent mental illness, and TR provides them with behavioral health treatment and supportive housing services to ensure these folks remain safe, healthy, and housed. I served on TR's board for 15 years and can testify to its success at building community and stability for individuals who previously did not enjoy these things. TR owns or rents several properties and serves a multitude of people who live in various parts of West Seattle, but the majority of people it serves have their homes within very close proximity to TR's offices that are located on SW Avalon Way. Many of the people that TR serves will be irrevocably negatively impacted by the proposed alternative routes outlined in DEL-5 and DEL-6 if these options move forward. DEL-6 would be particularly devastating for them, but DEL-5 would also cause disruption and uprooting of people for whom such experiences are particularly difficult.

The planned route for DEL-5 and DEL-6 would directly impact three of Transitional Resources' properties and would catastrophically alter TR's ability to deliver its vital programs and services to our community. Without these services or programs, the people who live in the impacted buildings —as well as those who receive behavioral health services in those buildings--would be displaced and/or disconnected from the services they need. The loss of these critical services in our community would be devastating not only to the people they serve, but to our larger community, as finding alternative housing and services that address the unique needs of the populations they serve in the same way TR does would be challenging. Some of the people who will be displaced have lived in their homes for two decades or more. The impact of the loss of a home for these individuals cannot be determined in simple monetary terms. They are particularly vulnerable to change. They need access to resources that are at or very near their homes. I ask you to take this into consideration. TR has been a success story in helping solve one of this area's thorniest and persistent issues. Please preserve that success.

As someone who cares deeply about our community and my vulnerable neighbors who are served by the nonprofits that provide support that they need, I strongly urge Sound Transit to reject both the DEL-5 and DEL-6 alternative proposals. Thank you for this opportunity to provide input and your consideration.

West Seattle Golf Course Form Letter

Letter:

I am commenting on the Delridge section of the West Seattle Light Rail project DEIS. I support either of the Yancy/Avalon routes.

I oppose any of the alternatives that impact the West Seattle Golf Course. In addition, any of the tunnel alternatives are completely unacceptable due to the loss of over 3 aces of the golf course which is Park property.

The reasons are the following:

1) The budget is the same or cheaper for the Yancy/Avalon routes, 1.6 B and 1.5 B.
2) The business disruption is closely similar for both of these options.
3) The private property disruption is less for both Yancy alternatives, from 607 for DEL1a down to 201 or 487.
4) The Genesee routes violate a City ordinance driven by a citizen initiative that park property cannot be used for purposes other than what it was intended for.
5) The loss of revenue and loss of recreation opportunity would not be impacted for over 60,000 golfers each year.
6) There would be no risk of golf balls hitting the trains.
7) The Parks Department supports the Yancy alternatives.
8) This is the only golf course that serves the West Seattle community.
9) Longfellow Creek would have no risk of damage to the fish or the creek.
10) The mature trees all along the North edge of the golf course would not be cut down.

Please adjust the preferred alternative to either of the Yancy/Avalon routes.

Comment Responses:

Comment	Response
I support either of the Yancy/Avalon routes. I oppose any of the alternatives that impact the West Seattle Golf Course. In addition, any of the tunnel alternatives are completely unacceptable due to the loss of over 3 acres of the golf course which is Park property.	Please see responses to CCG2 and CC4.17b in Table 7-1 in Chapter 7, Comment Summary, of the West Seattle Link Extension Final EIS. There are no project alternatives that would result in the loss of over 3 acres of golf course property.
The reasons are the following: 1) The budget is the same or cheaper for the Yancy/Avalon routes, 1.6 B and 1.5 B. 2) The business disruption is closely similar for both of these options. 3) The private property disruption is less for both Yancy alternatives, from 607 for DEL1a down to 201 or 487. 4) The Genesee routes violate a City ordinance driven by a citizen initiative that park property cannot be used for purposes other than what it was intended for. 5) The loss of revenue and loss of recreation opportunity would not be impacted for over 60,000 golfers each year. 6) There would be no risk of golf balls hitting the trains. 7) The Parks Department supports the Yancy alternatives. 8) This is the only golf course that serves the West Seattle community. 9) Longfellow Creek would have no risk of damage to the fish or the creek. 10) The mature trees all along the North edge of the golf course would not be cut down.	For more information, please see these sections of the Final EIS: • Project cost: Section 2.9, Project Funding and Cost Comparison • Residential and business displacements: Section 4.1, Acquisitions, Displacements, and Relocations, and Section 4.3, Economics • Park impacts, include City ordinance: Section 4.17, Parks and Recreational Resources • Ecosystem resources (Longfellow Creek and trees): Section 4.9, Ecosystems As noted in Attachment G of comments submitted by the City of Seattle (see Section O.2.2 of this appendix), the City expressed concern that "the tunnel portal alternatives on the south side of Southwest Genesee Street would have significant impacts on golf course playability, operations, and revenue."
Please adjust the preferred alternative to either of the Yancy/Avalon routes.	Please see response to CCG2 in Table 7-1.

Communication (4/15/2022)

I am commenting on the Delridge section of the West Seattle Light Rail project DEIS. I support either of the Yancy/Avalon routes. I oppose any of the alternatives that impact the West Seattle Golf Course. In addition, any of the tunnel alternatives are completely unacceptable due to the loss of over 3 aces of the golf course which is Park property.

The reasons are the following:

1. The budget is the same or cheaper for the Yancy/Avalon routes, 1.6 B and 1.5 B
2. The business disruption is closely similar for both of these options
3. The private property disruption is less for both Yancy alternatives, from 607 for DEL1a down to 201 or 487
4. The Genesee routes violate a City ordinance driven by a citizen initiative that park property cannot be used for purposes other than what it was intended for
5. The loss of revenue and loss of recreation opportunity would not be impacted for over 60,000 golfers each year
6. There would be no risk of golf balls hitting the trains
7. The Parks Department supports the Yancy alternatives
8. This is the only golf course that serves the West Seattle community
9. Longfellow Creek would have no risk of damage to the fish or the creek
10. The mature trees all along the North edge of the golf course would not be cut down

Please adjust the preferred alternative to either of the Yancy/Avalon routes. Thank you

Communication (4/16/2022)

I am commenting on the Delridge section of the West Seattle Light Rail project DEIS. I support either of the Yancy/Avalon routes. I oppose any of the alternatives (along Genessee) that impact the West Seattle Golf Course. In addition, any of the tunnel alternatives are completely unacceptable due to the loss of over 3 acres of the golf course which is Park property.
Here are several more reasons for my support of Andover/Yancy/Avalon routes.

1. The budget is the same or cheaper for the Yancy/Avalon routes, $1.6 B/ $1.5 B. Saving $100 million seems very prudent!
2. The business disruption is similar for both of these options
3. The private property disruption is less for both Andover/Yancy alternatives, from 607 for DEL1a down to 201 or 487
4. The Genesee routes violate a City ordinance driven by a citizen initiative that park property cannot be used for purposes other than what it was intended for
5. The loss of revenue and loss of recreation opportunity could impact over 60,000 golfers each year
6. The Parks Department supports the Andover/Yancy alternatives

Communication (4/16/2022)

Hello,
I am commenting on the Delridge section of the West Seattle Light Rail project DEIS. I support either of the Yancy/Avalon routes. I oppose any of the alternatives that impact the West Seattle Golf Course. In addition, any of the tunnel alternatives are completely unacceptable due to the loss of over 3 aces of the golf course which is Park property. Even if you are not a golfer, it is a beautiful green space in the middle of important area surrounded by land already taken for the bridge.

I would ask that you consider the following reasons for not destroying the West Seattle Golf Course:
1 The budget is the same or cheaper for the Yancy/Avalon routes, 1.6 B and 1.5 B
2) The business disruption is closely similar for both of these options
3) The private property disruption is less for both Yancy alternatives, from 607 for DEL1a down to 201 or 487
4) The Genesee routes violate a City ordinance driven by a citizen initiative that park property cannot be used for purposes other than what it was intended for - this is a very important fact! This is the second time that destroying a park property in the form of golf courses has come up and there is no reason to violate the City ordinance.
5) The loss of revenue and loss of recreation opportunity would not be impacted for over 60,000 golfers each year - who are voters and taxpayers too.
6) There would be no risk of golf balls hitting the trains
7) The Parks Department supports the Yancy alternatives
8) This is the only golf course that serves the West Seattle community
9) Longfellow Creek would have no risk of damage to the fish or the creek
10) The mature trees all along the North edge of the golf course would not be cut down
For all of the above reasons, please adjust the preferred alternative to either of the Yancy/Avalon routes. Thank you

Communication (4/16/2022)

I am commenting on the Delridge section of the West Seattle Light Rail project DEIS.

I support either of the Andover/Yancy/Avalon routes.

I oppose any of the alternatives along Genesee that impact the West Seattle Golf Course.

And I strongly oppose tunnel alternatives that are unacceptable due to the loss of over 3 acres of the golf course which is Park property.
Some of the reasons for supporting Andover/Yancy Avalon routes include:

1. Estimated budget is the same or cheaper for Andover/Yancy/Avalon routes at $1.6 B or $1.5 B. (Any reasonable option at $100 million less cost should be preferred)
2. The business disruption is closely similar for both of these options
3. The private property disruption is less for both Yancy alternatives, from 607 for DEL1a down to 201 or 487
4. The Genesee routes likely violate Seattle City ordinance driven by a citizen initiative that park property cannot be used for purposes other than what it was intended for
5. The Parks Department supports the Andover/Yancy/Avalon alternatives
6. The West Seattle golf course has served the citizens of Seattle with excellent recreation, community fabric and vibrancy as a business for over 80 years. While respecting the need for light rail, the alternative routes that do not impact this unique use of parkland are preferred.

7. The Parks Department supports the Yancy alternatives
8. This is the only golf course that serves the West Seattle community
9. Longfellow Creek would have no risk of damage to the fish or the creek
10. The mature trees all along the North edge of the golf course would not be cut down

Please adjust the preferred alternative to either of the Yancy/Avalon routes. Thank you.

Communication (4/19/2022)

I am commenting on the Delridge section of the West Seattle Light Rail project DEIS. I support either of the Yancy/Avalon routes. I oppose any of the alternatives that impact the West Seattle Golf Course. In addition, any of the tunnel alternatives are completely unacceptable due to the loss of over 3 aces of the golf course which is Park property.

The reasons are the following:

1. The budget is the same or cheaper for the Yancy/Avalon routes, 1.6 B and 1.5 B
2. The business disruption is closely similar for both of these options
3. The private property disruption is less for both Yancy alternatives, from 607 for DEL1a down to 201 or 487
4. The Genesee routes violate a City ordinance driven by a citizen initiative that park property cannot be used for purposes other than what it was intended for
5. The loss of revenue and loss of recreation opportunity would not be impacted for over 60,000 golfers each year
6. There would be no risk of golf balls hitting the trains
7. The Parks Department supports the Yancy alternatives
8. This is the only golf course that serves the West Seattle community
9. Longfellow Creek would have no risk of damage to the fish or the creek
10. The mature trees all along the North edge of the golf course would not be cut down

Please adjust the preferred alternative to either of the Yancy/Avalon routes. Thank you

I am commenting on the Delridge section of the West Seattle Light Rail project DEIS. I support either of the Yancy/Avalon routes. I oppose any of the alternatives that impact the West Seattle Golf Course. In addition, any of the tunnel alternatives are completely unacceptable due to the loss of over 3 aces of the golf course which is Park property.

The reasons are the following:

First and foremost The Genesee routes violate a City ordinance driven by a citizen initiative that park property cannot be used for purposes other than what it was intended for. The cost of the litigation to come from this violation is enough reason to not pursue these options

2. The budget is the same or cheaper for the Yancy/Avalon routes, 1.6 B and 1.5
3. The Parks Department supports the Yancy alternatives
4. The private property disruption is less for both Yancy alternatives, from 607 for DEL1a down to 201 or 487
5. The loss of revenue and loss of recreation opportunity would not be impacted for over 60,000 golfers each year
6. Environmental impact of Longfellow Creek would be substantial if the Genessee routes are allowed.
7. This is the only golf course that serves the West Seattle community

Please adjust the preferred alternative to either of the Yancy/Avalon routes. Thank you

Communication (4/19/2022)

I am commenting on the Delridge section of the West Seattle Light Rail project DEIS. I support either of the Yancy/Avalon routes. I oppose any of the alternatives that impact the West Seattle Golf Course. In addition, any of the tunnel alternatives are completely unacceptable due to the loss of over 3 aces of the golf course which is Park property. Not to mention the costs for those options are probably exorbitant, and those options would potentially ruin the best community asset the great West Seattle neighborhood has in the golf course.

The reasons are the following:

1. The budget is the same or cheaper for the Yancy/Avalon routes, 1.6 B and 1.5 B
2. The business disruption is closely similar for both of these options
3. The private property disruption is less for both Yancy alternatives, from 607 for DEL1a down to 201 or 487
4. The Genesee routes violate a City ordinance driven by a citizen initiative that park property cannot be used for purposes other than what it was intended for
5. The loss of revenue and loss of recreation opportunity would not be impacted for over 60,000 golfers each year

Communication (4/19/2022)

I am commenting on the Delridge section of the West Seattle Light Rail project DEIS. I support either of the Yancy/Avalon routes.

I OPPOSE any of the alternatives that impact the West Seattle Golf Course.

In addition, any of the tunnel alternatives are completely unacceptable due to the loss of over 3 aces of the golf course which is Park property.

The reasons are below:

1. The budget is the same or cheaper for the Yancy/Avalon routes, 1.6 B and 1.5 B
2. The business disruption is closely similar for both of these options
3. The private property disruption is less for both Yancy alternatives, from 607 for DEL1a down to 201 or 487
4. The Genesee routes violate a City ordinance driven by a citizen initiative that park property cannot be used for purposes other than what it was intended for
5. The loss of revenue and loss of recreation opportunity would not be impacted for over 60,000 golfers each year
6. There would be no risk of golf balls hitting the trains
7. The Parks Department supports the Yancy alternatives
8. This is the only golf course that serves the West Seattle community
9. Longfellow Creek would have no risk of damage to the fish or the creek
10. The mature trees all along the North edge of the golf course would not be cut down

Please adjust the preferred alternative to the Yancy or Avalon routes.

Thank you

Communication (4/19/2022)

I would like to offer my opinion on the Delridge section of the West Seattle Light Rail project DEIS. I support either of the Yancy/Avalon routes. I oppose any of the alternatives that impact the West Seattle Golf Course. In addition, any of the tunnel alternatives are unacceptable in my view due to the cost, time and loss of over 3 aces of the golf course which is Park property.

Other reasons to not use the Genesee route are below:

1. The budget appears to be roughly the same if not cheaper using the Yancy/Avalon routes.
2. The business disruption is closely similar for both of these options
3. The private property disruption is less for both Yancy alternatives, from 607 for DEL1a down to 201 or 487.
4. The Genesee routes violate a City ordinance driven by a citizen initiative that park property cannot be used for purposes other than what it was originally intended.
5. The loss of revenue and loss of recreation opportunity would not be impacted for over 60,000 golfers each year.
6. There would be no risk of golf balls hitting the trains.
7. The Parks Department supports the Yancy alternatives.
8. This is the only golf course that serves the West Seattle community.
9. The risk of damage to Longfellow Creek, fish and wild life in the area is greatly reduced or eliminated.
10. The mature trees all along the North edge of the golf course would not be cut down.

3. The private property disruption is less for both Yancy alternatives, from 607 for DEL1a down to 201 or 487
4. The Genesee routes violate a City ordinance driven by a citizen initiative that park property cannot be used for purposes other than what it was intended for
5. The loss of revenue and loss of recreation opportunity would not be impacted for over 60,000 golfers each year
6. There would be no risk of golf balls hitting the trains
7. The Parks Department supports the Yancy alternatives
8. This is the only golf course that serves the West Seattle community
9. Longfellow Creek would have no risk of damage to the fish or the creek
10. The mature trees all along the North edge of the golf course would not be cut down

Please adjust the preferred alternative to either of the Yancy/Avalon routes. Thank you

I am commenting on the Delridge section of the West Seattle Light Rail project DEIS. I support either of the Yancy/Avalon routes. I oppose any of the alternatives that impact the West Seattle Golf Course. In addition, any of the tunnel alternatives are completely unacceptable due to 3 acres of the golf course which is Park property.

The reasons are the following:
1). The budget is the same or cheaper for Yancy/Avalon routes, 1.6 B and 1.5 B.
2). The business disruption is closely similar for both of these options.
3) The private property disruption is less for both Yancy alternatives, from 607 for DEL1a down to 201 or 487.
4). The Genesee routes violate a City ordinance driven by a citizen initiative that park property cannot be used for purposes other than what it was intended for.
5). The loss of revenue and loss recreation opportunity would not be impacted for over 60,000 golfers each year.
6). There would be no risk of golf balls hitting the trains.
7). The Parks Department supports the Yancy alternatives.
8). This is the only golf course that serves the West Seattle community.
9). Longfellow Creek would have no risk of damage to the fish or the creek.
10) The mature trees all along the North edge of the golf course would not be cut down.

Communication (4/19/2022)

I am commenting on the Delridge section of the West Seattle Light Rail project DEIS. I support either of the Yancy/Avalon routes. I oppose any of the alternatives that impact the West Seattle Golf Course. In addition, any of the tunnel alternatives are completely unacceptable due to the loss of over 3 aces of the golf course which is Park property.

I'm an active golfer at West Seattle and support the reasoning listed here:

1. The budget is the same or cheaper for the Yancy/Avalon routes, 1.6 B and 1.5 B
2. The business disruption is closely similar for both of these options
3. The private property disruption is less for both Yancy alternatives, from 607 for DEL1a down to 201 or 487
4. The Genesee routes violate a City ordinance driven by a citizen initiative that park property cannot be used for purposes other than what it was intended for
5. The loss of revenue and loss of recreation opportunity would not be impacted for over 60,000 golfers each year
6. There would be no risk of golf balls hitting the trains

Communication (4/19/2022)

I am commenting on the Delridge section of the West Seattle Light Rail project DEIS. I support either of the Yancy/Avalon routes as opposed to any of the alternatives that impact the West Seattle Golf Course. In addition, any of the tunnel alternatives are completely unacceptable due to the loss of over 3 acres of the golf course which is Seattle Park's property.

I believe the following reasons demonstrate why the project should favor the Yancy/Avalon routes -

1. The budget is the same or cheaper for the Yancy/Avalon routes, 1.6 B and 1.5 B
2. The business disruption is similar for both of these options
3. The private property disruption is less for both Yancy alternatives, from 607 for DEL1a down to 201 or 487
4. The Genesee routes violate a City ordinance driven by a citizen initiative that park property cannot be used for purposes other than what it was intended for
5. The loss of revenue and loss of recreation opportunity would impact over 60,000 golfers each year and employees of the facility
6. There no risk of golf balls hitting the trains
7. The Parks Department supports the Yancy alternatives
8. This West Seattle Golf course is the only golf course that serves the West Seattle community and surrounding areas. Additionally given the reputation the golf course has acquired, many golfers from all around the Seattle-Tacoma area choose to play at the course even if they do not live in West Seattle
9. Longfellow Creek would have no risk of damage to the fish or the creek
10. The mature trees all along the North edge of the golf course would not be cut down

Please adjust the preferred alternative to either of the Yancy/Avalon routes.

I am commenting on the Delridge section of the West Seattle Light Rail project DEIS. I support either of the Yancy/Avalon routes. I oppose any of the alternatives that impact the West Seattle Golf Course. In addition, any of the tunnel alternatives are completely unacceptable due to the loss of over 3 acres of the golf course which is Park property.

The reasons are the following:

1. The budget is the same or cheaper for the Yancy/Avalon routes, 1.6 B and 1.5 B
2. The business disruption is closely similar for both of these options
3. The private property disruption is less for both Yancy alternatives, from 607 for DEL1a down to 201 or 487
4. The Genesee routes violate a City ordinance driven by a citizen initiative that park property cannot be used for purposes other than what it was intended for
5. The loss of revenue and loss of recreation opportunity would not be impacted for over 60,000 golfers each year
6. There would be no risk of golf balls hitting the trains
7. The Parks Department supports the Yancy alternatives
8. This is the only golf course that serves the West Seattle community
9. Longfellow Creek would have no risk of damage to the fish or the creek
10. The mature trees all along the North edge of the golf course would not be cut down

Please adjust the preferred alternative to either of the Yancy/Avalon routes. Thank you

I am commenting on the Delridge section of the West Seattle Light Rail project DEIS. I support either of the Yancy/Avalon routes. I oppose any of the alternatives that impact the West Seattle Golf Course. In addition, any of the tunnel alternatives are completely unacceptable due to the loss of over 3 aces of the golf course which is Park property. I would think as a progressive city, the impact on the environment is as important as well. Parks provide that and should be preserved. In addition, reasons for opposition is as follows.

1. The budget is same or cheaper for Yancy/Avalon routes. I would like to think the city is fiscally responsible.
2. Private property disruption is less for both Yancy alternatives, from 607 for DEL1a down to 201 or 487.
3. I believe there is a city ordinance driven by citizen initiative that park property cannot be used for the purposes other than what it was intended for.
4. Loss of revenue for the city and impacting over 60,000 golfers each year.
5. Risk of golf balls hitting the trains.
6. City Parks Department supports the Yancy alternatives.
7. Environmental impact on Longfellow Creek to fish and other wildlife.

Please adjust the preferred alternative to either of the Yancy/Avalon routes.
Thank you.

10. The mature trees all along the North edge of the golf course would not be cut down

Destroying the only good course left in all of the Seattle public courses will have a dramatic effect. This course is very popular and busy year round.
